حالت استاندارد سرعت و ولتاژ:
– در صورتیکه سرعت (speed) دستگاه روی ۲۵ باشد، هر ۲۵ مربع کوچک معادل یک ثانیه می‌شود و چنانچه ولتاژ دستگاه روی عدد ۱ تنظیم شده باشد هر ۱۰ مربع کوچک معادل ۱ میلی ولت می‌باشد.
زمان
مراحل تفسیر نوار قلبی
۱– بررسی شرح حال بیمار
۲– آیا موج P دارد؟
۳– آیا فاصله PR طبیعی است؟
۴– آیا تمام امواج P و QRS شبیه و شکل طبیعی دارند؟
۵– آیا فاصله زمانی و ارتفاع QRS طبیعی است؟
۶– آیا فواصل PP و PR مساوی است؟
۷– آیا قطعه ST بالارونده و یا پایین رونده است؟
۸– آیا فاصله QT طبیعی است؟
۹– تعداد ضربان دهلیز و بطن چقدر است؟
۱۰– محور الکتریکی قلب؟
نحوه محاسبه تعداد ضربان قلب از روی نوار قلبی
روش اول: شمارش مربع‌های بزرگ بین دو قله R و تقسیم کردن عدد ۳۰۰ بر تعداد مربع‌ها.
روش دوم: شمارش مربع‌های کوچک و تقسیم عدد ۱۵۰۰ بر تعداد مربع‌ها.
تغییرات موج T و قطعه ST

آریتمی های دهلیزی
۱ – ضربان زودرس دهلیزی (Premature Atrial Contracture/ PAC)
۲– پیس میکر سرگردان (Wandering Pacemaker/ Multifocal atrial Rhythm)
۳ –تاکیکاردی چند کانونی دهلیزی (Multifocal Atrial Tachycardia/ MAT)
۴– تاکیکاردی حمله‌ای دهلیزی (Paroxysmal atrial Tachycardia/ PAT)
۵– فلاتر دهلیزی (Atrial Flutter)
۶– فیبریلاسیون دهلیزی (Atrial Fibrillation/ AF)
آریتمی های بطنی
۱– ضربان زودرس بطنی (Premature Ventricular Complex/ PVC/ Ventricular Extrasystole)
۲ –ریتم ایدیوونتریکولار (Idioventricular Rhythm)
نکته: ریتم Accelerated idioventricular دارای سرعت ۴۰ تا ۱۰۰ بار در دقیقه می باشد.
۳– تورسادس دی پوینت (Torsades de Point)
۴–فیبریلاسیون بطنی (Ventricular Fibrillation)
coarse VF
fine VF
ارتعاش سلولهای بطنی که منجر به انقباض کامل قلب نمی شود. درمان با شوک الکتریکی انجام می شود.

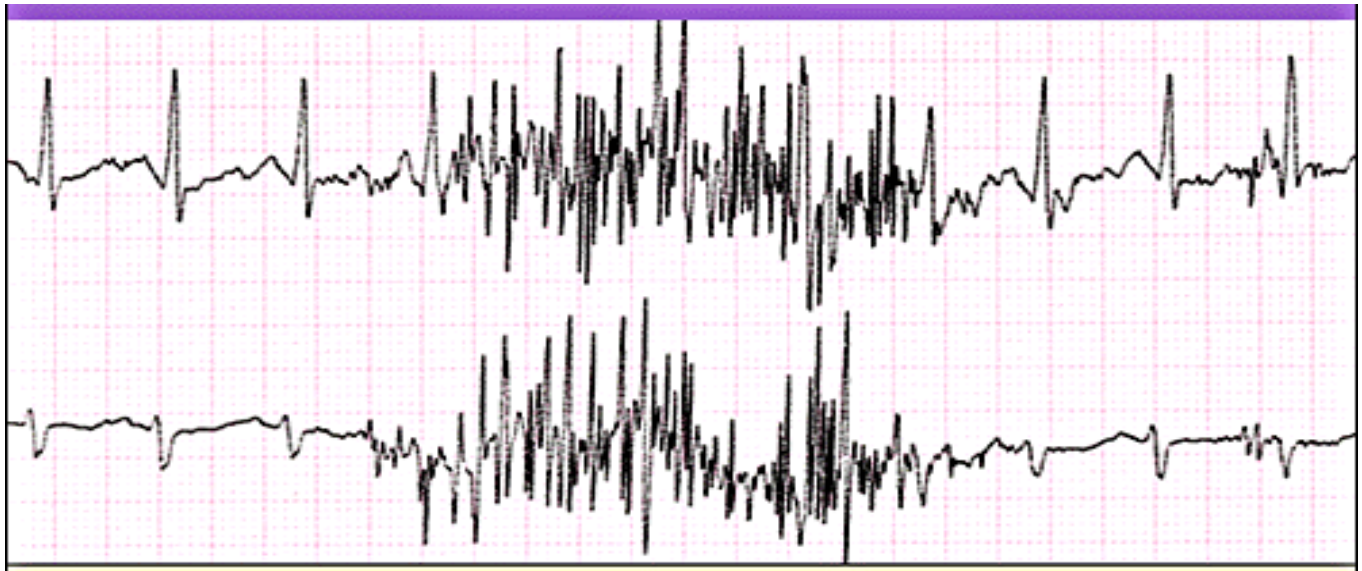
Muscle Tremor



Electrical interference caused by the patient's tensed muscles.

- Limb movements cause baseline fluctuations
- Tense muscles cause tremor of baseline
- Hairy chest interferes with proper contact of chest leads – better to shave the area if needed.
- Reassurance, starting recording a few minutes after the leads are placed – reduce muscle tension

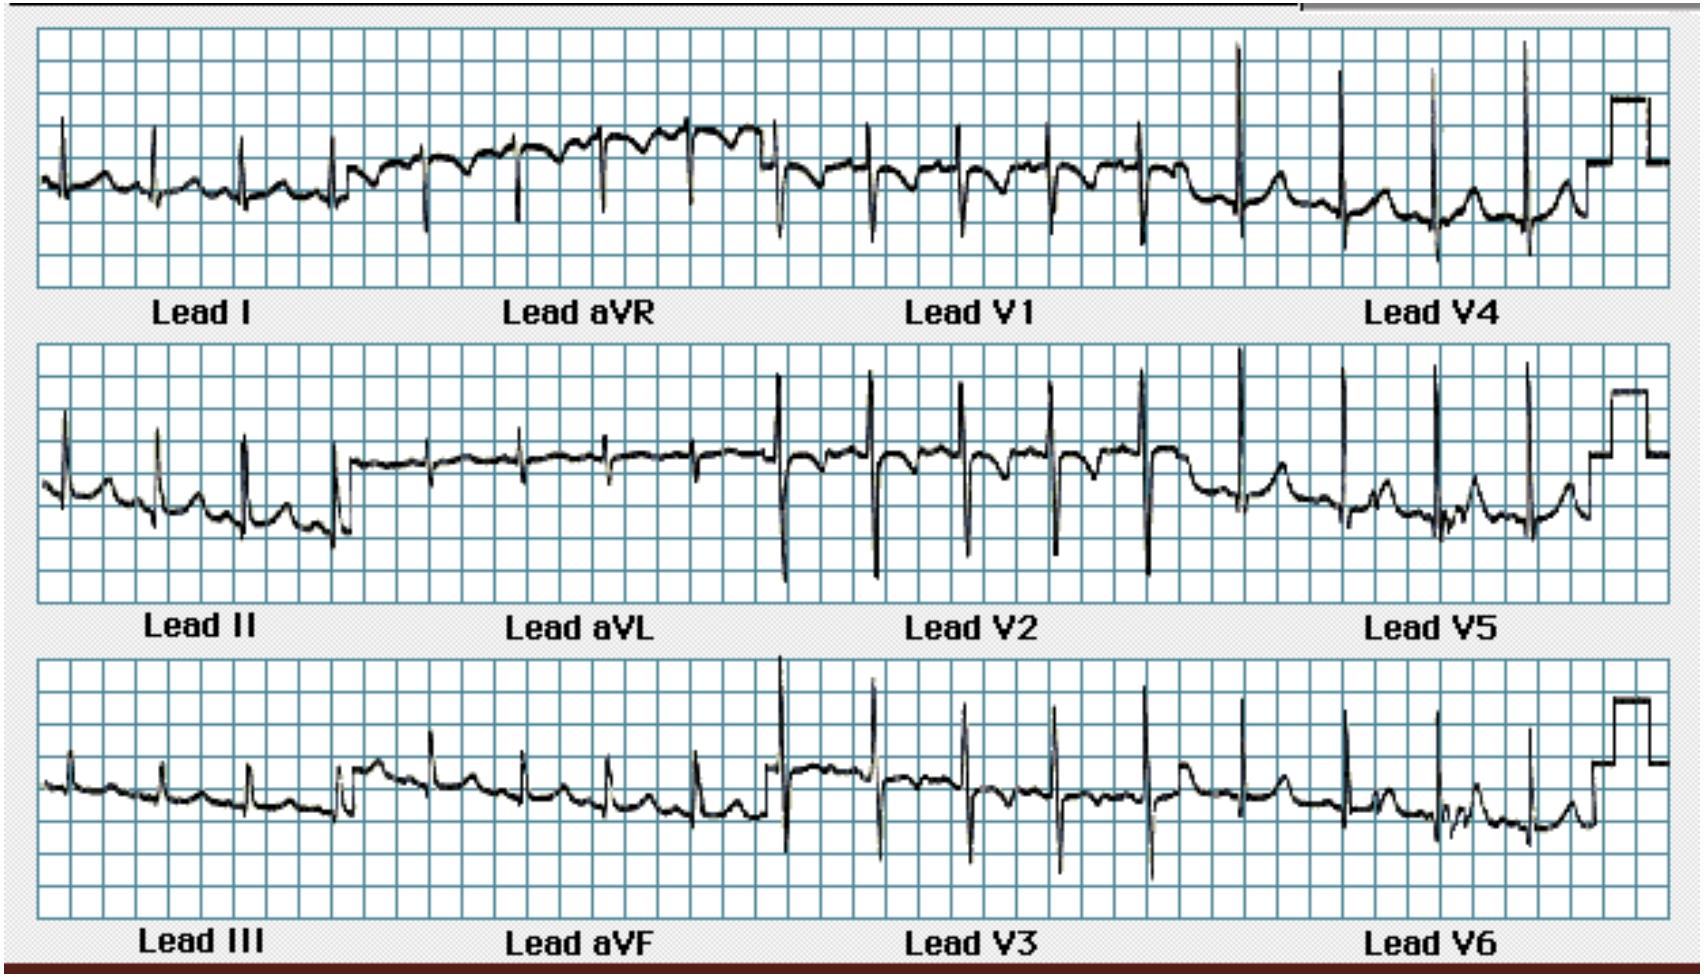
Normal ECG

- Standardization – 10 mm (2 boxes) = 1 mV
- Double and half standardization if required
- Sinus Rhythm – Each P followed by QRS, R-R constant
- P waves – always examine for in L2, V1, L1
- QRS positive in L1, L2, L3, aVF and aVL. – Neg in aVR
- QRS is < 0.08 narrow, Q in V5, V6 < 0.04, < 3 mm
- R wave progression from V1 to V6, QT interval < 0.4
- Axis normal – L1, L3, and aVF all will be positive
- ST Isoelectric, T waves ↑, Normal T↓ in aVR,V1, V2

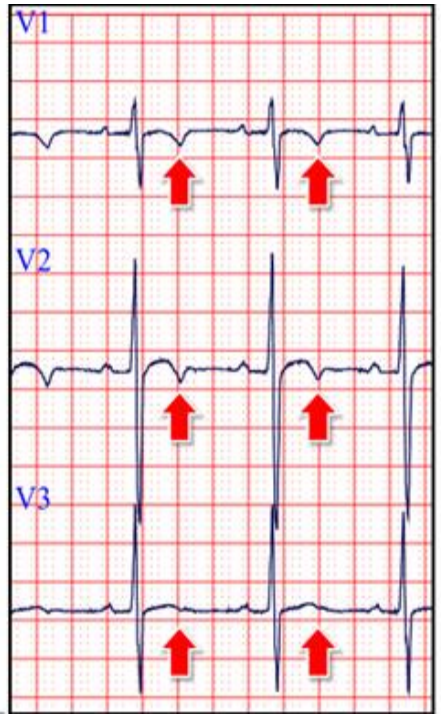
Pediatric ECG

- This is the ECG of a 6 year old child
- Heart rate is 100 – Normal for the age
- See V1 + V5 R >> 35 – Not LVH – Normal
- T↓ in V1, V2, V3 – Normal in child
- Base line disturbances in V5, V6 – due to movement by child

Pediatric ECG



Persistent Juvenile Pattern



Normal Variations in ECG

- May have slight left axis due to rotation of heart
- May have high voltage QRS – simulating LVH
- Mild slurring of QRS but duration < 0.09
- J point depression, early repolarization
- T inversions in V2, V3 and V4 – Juvenile T ↓
- Similarly in women also T↓
- Low voltages in obese women and men
- Non cardiac causes of ECG changes may occur

Pseudo Normalization

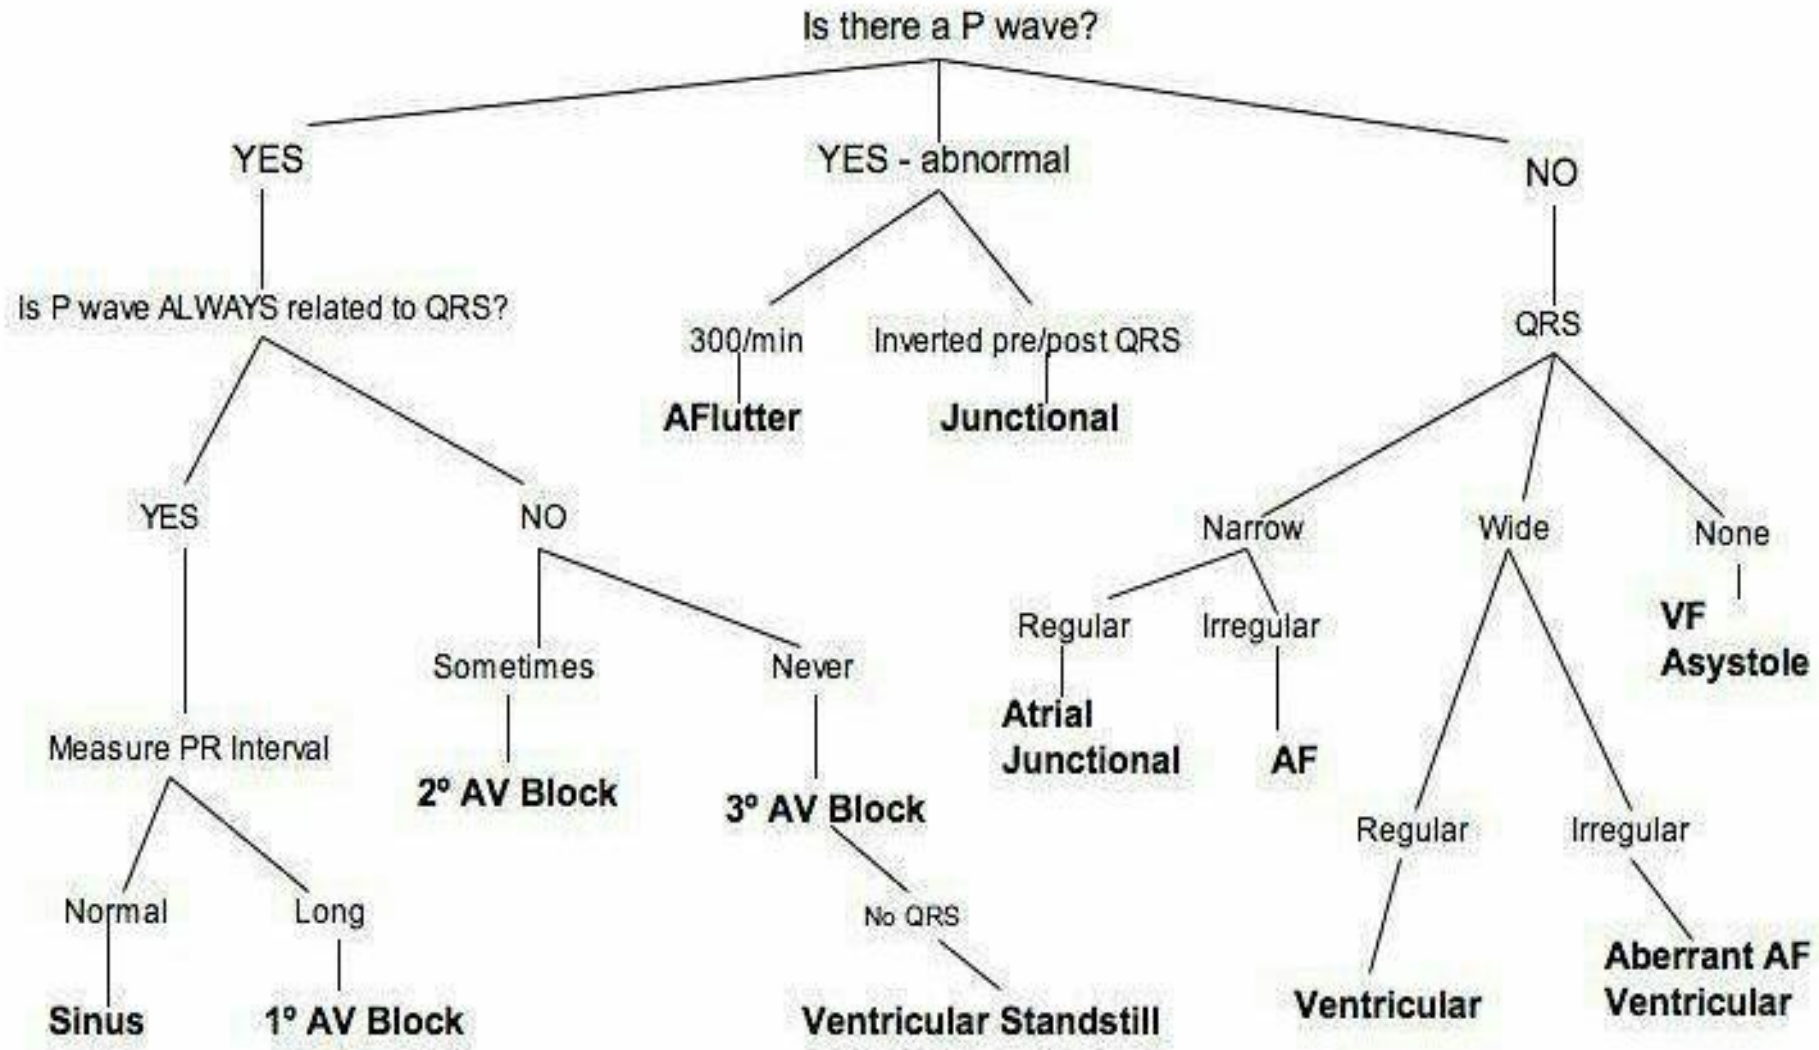
ECG INTERPRETATION FLOWCHART

Elizabeth Gherardin Box Hill Hospital 1999



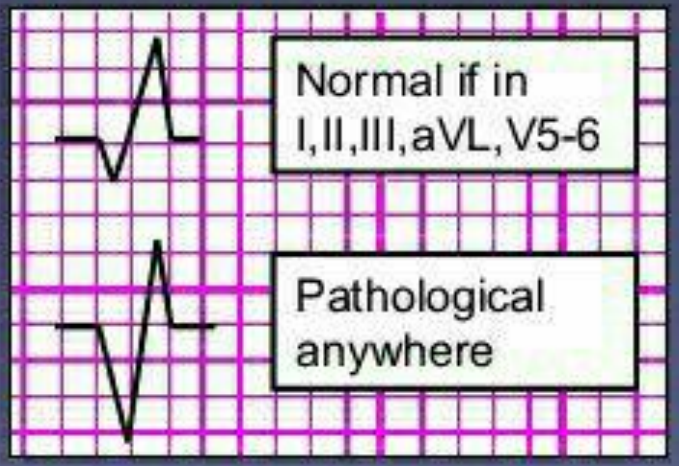
The Q wave

Are there any pathological Q waves?

- A Q wave can be pathological if it is:
  - Deeper than 2 small squares (0.2mV)

  and/or
  - Wider than 1 small square (0.04s)

  and/or
  - In a lead other than III or one of the leads that look at the heart from the left (I, II, aVL, V5 and V6) where small Qs (i.e. not meeting the criteria above) can be normal



Normal Q Waves

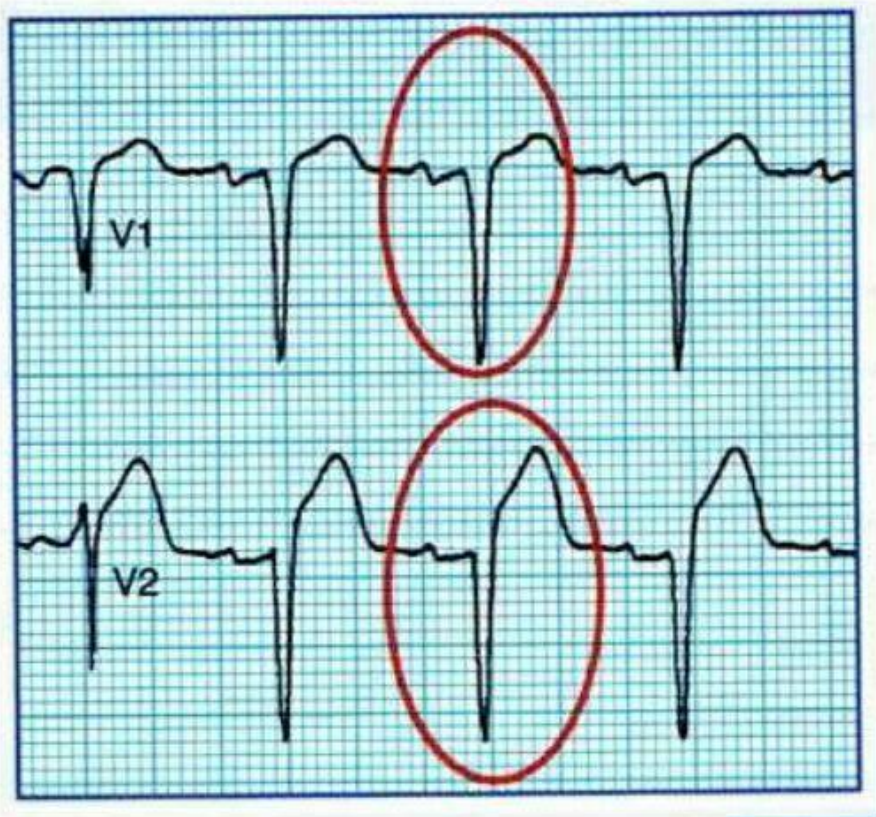
- The normal Q wave in lead I is due to septal depolarization
- It is small in amplitude – less than 25% of the succeeding R wave, or less than 3 mm
- Its duration is < 0.04 sec or one small box
- It is seen in L1 and some times in V5, V6

Pathological Q wave

- The pathological Q wave of infarction in the respective leads is due to dead muscle
- It is deep in amplitude – more than 25% of the succeeding R wave, or more than 4 mm
- Its duration is > 0.04 sec or > 1 small box
- It is seen in Leads facing the infarcted muscle mass

Pathological Q Wave

- Signifies infarction, or death of the tissue
- Indicators of an Infarct
  - Pathological Q wave
  - >40 ms, or 0.04 sec wide, or 1/3 of R wave height
  - Indicates on-going or permanent damage

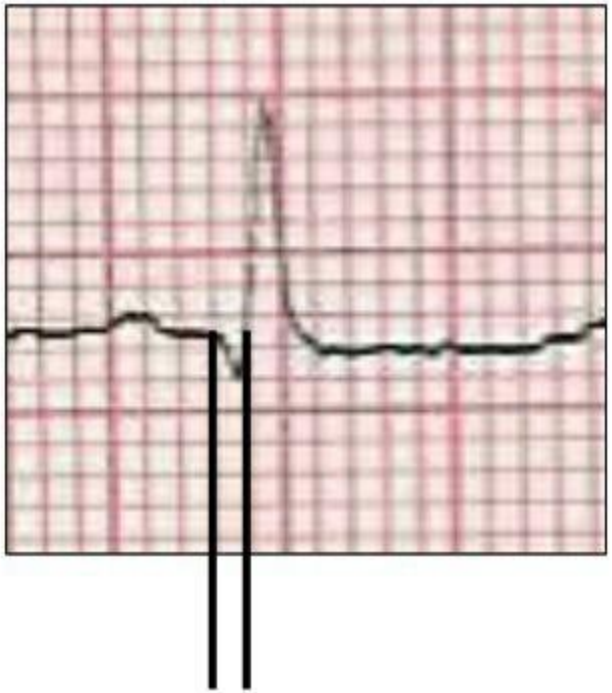


Q Waves

Pathological

> 1mm

Physiological



< 1mm

ST Segment

- The ST segment is normally level with the T-P segment rather than the PR segment

- Examine every lead for ST segment elevation of 1 mm or more.

T Wave

- Large wave form following QRS Complex
- Represents Ventricular Repolarization
- Should be upright in most leads (III and V1)
- Look for consistent morphology

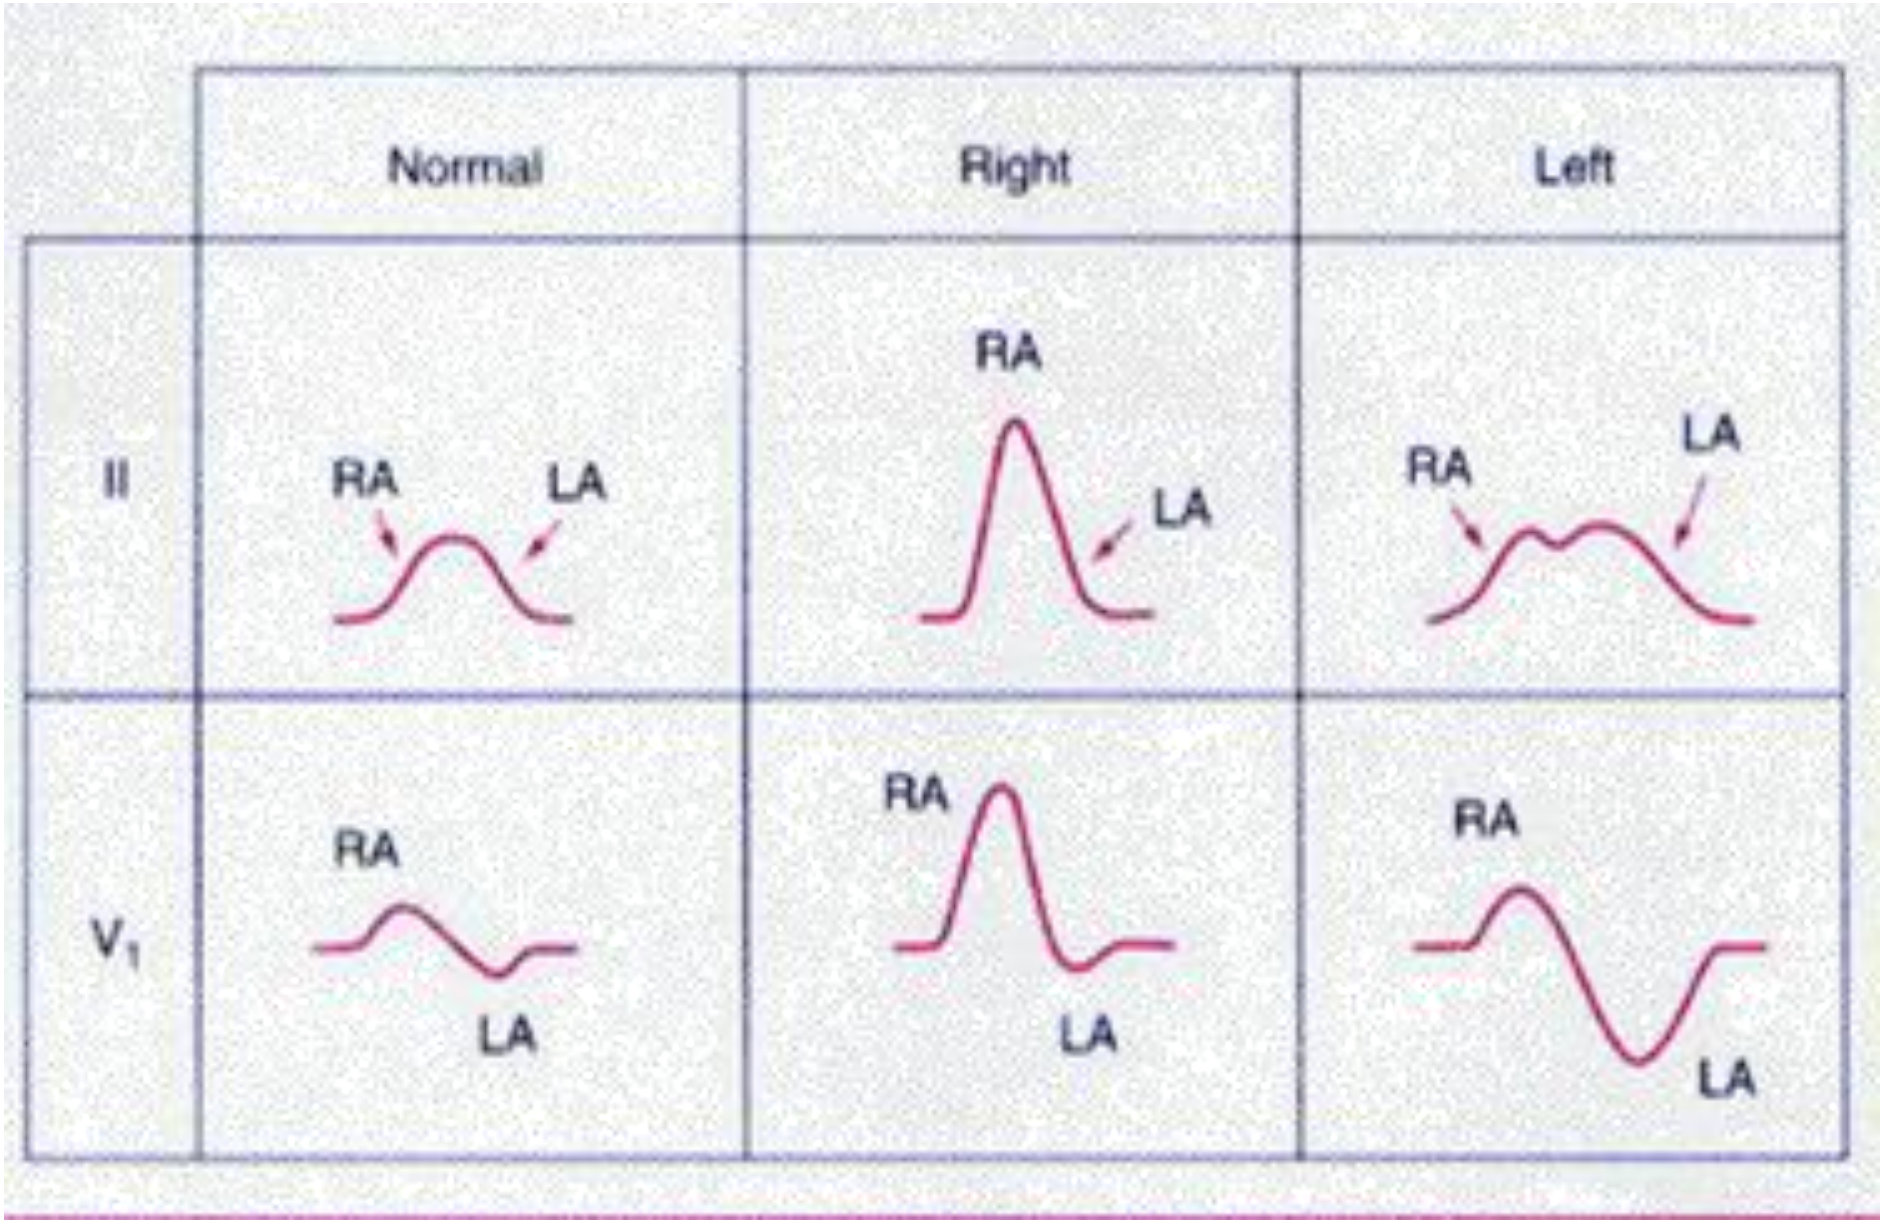
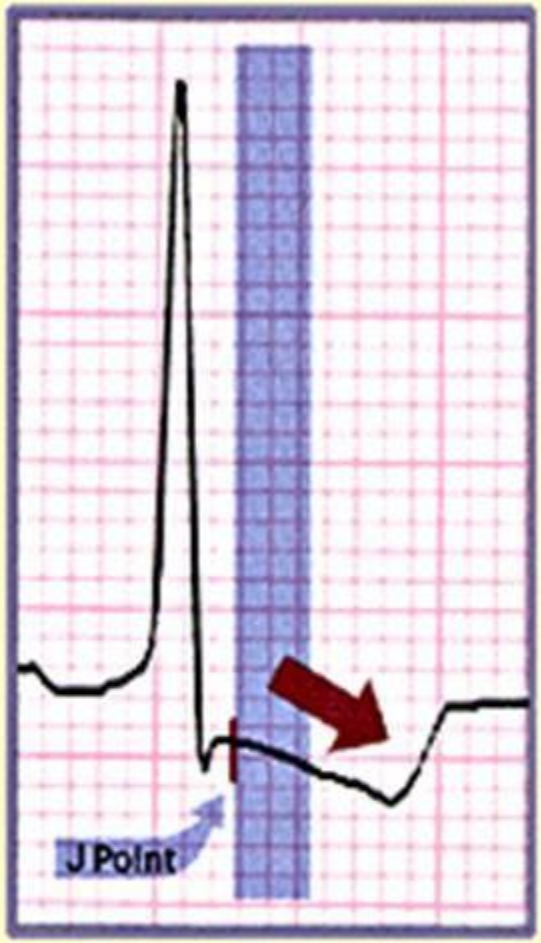
Left	Positive	Negative	Leave
Indeterminate	Negative	Positive	Meet

Atrial Waves

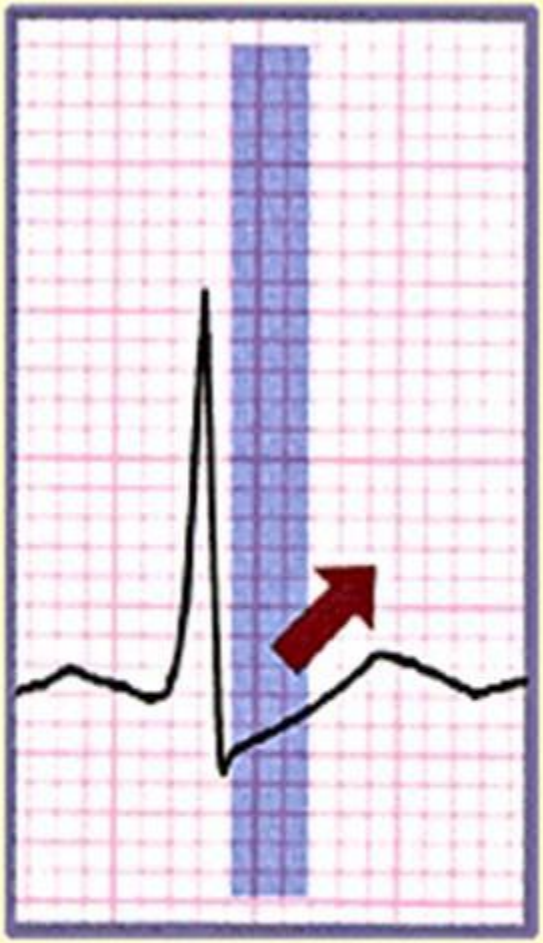


Atrial Ectopics

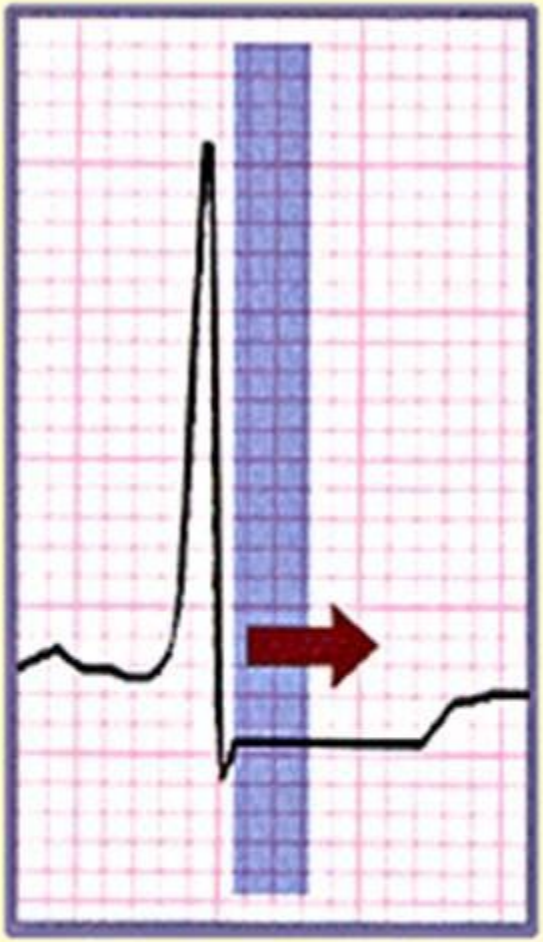
- Note the premature (ectopic) beats marked as
- APC (Atrial Premature Contractions)
- These occurred before the next expected QRS complex (premature)
- Each APC has a P wave preceding the QRS of that beat – So impulse has originated in the atria
- The QRS duration is normal < 0.08, not wide



Downsloping ST



Upsloping ST

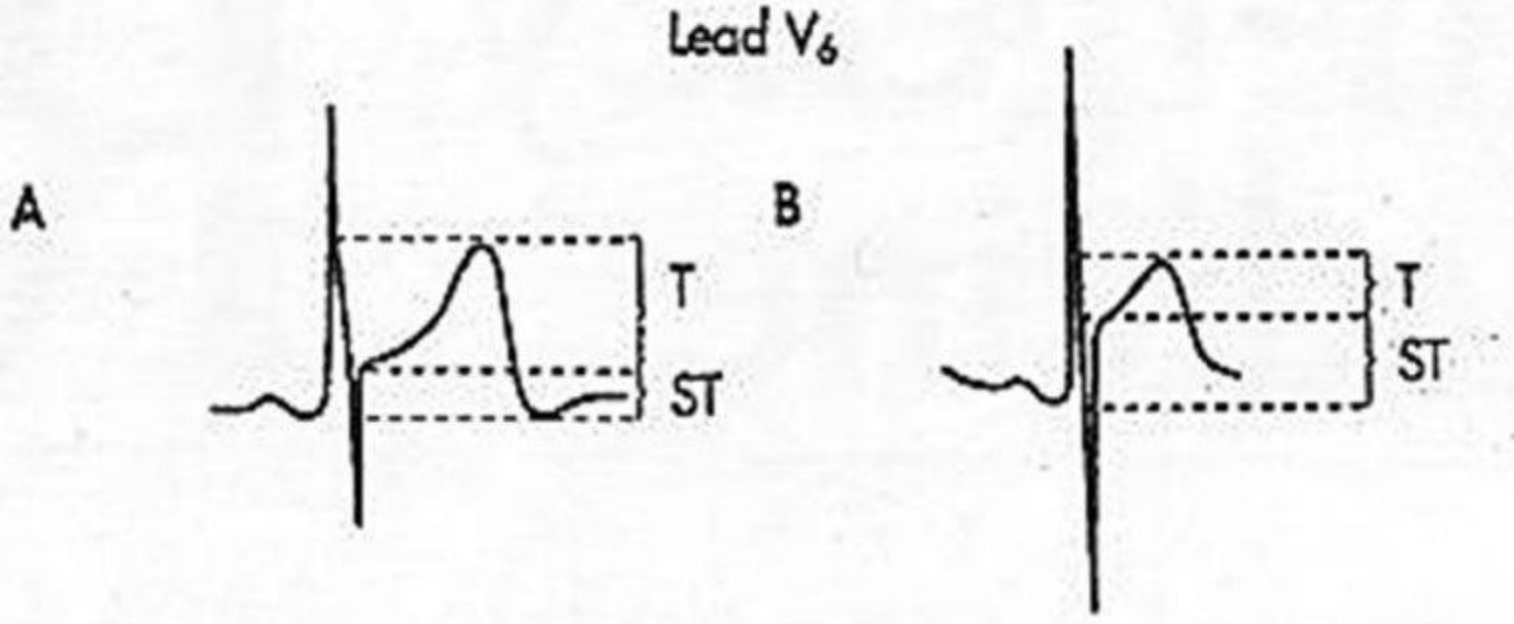


Horizontal ST

The J point occurs at the end of the QRS comples.
The ST segment begins at the J point and extends to a user defined interval

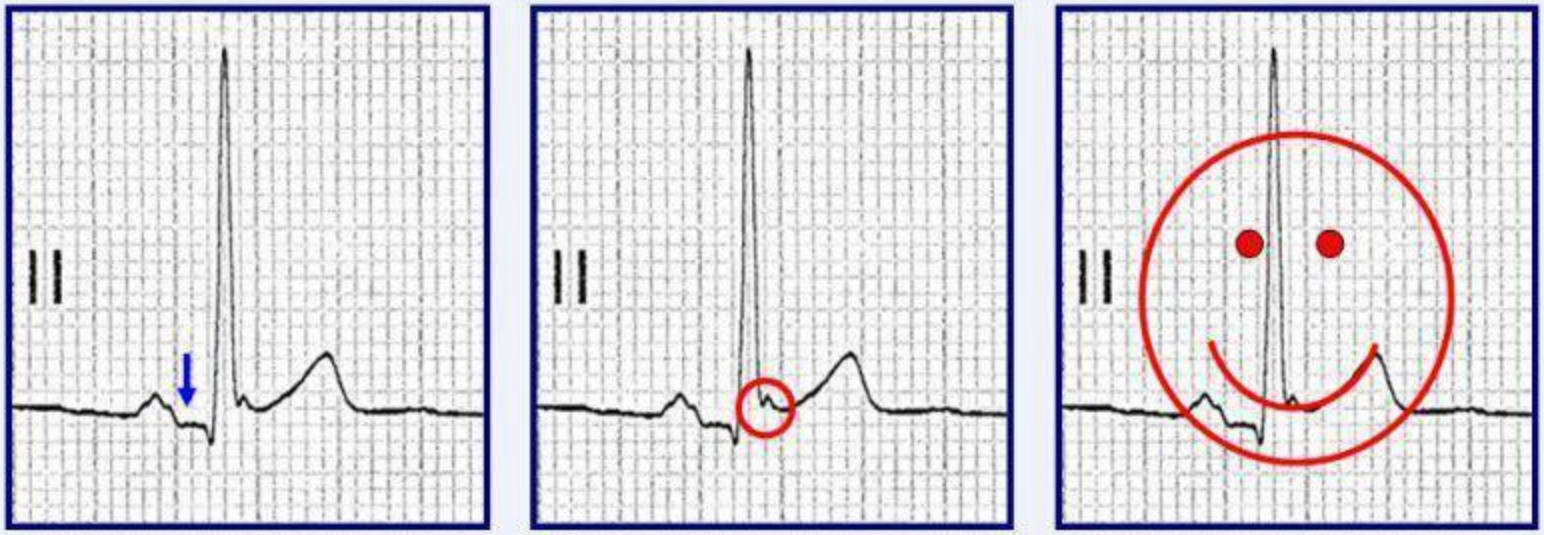
ST Segment Depression

BER vs Pericarditis



Benign early repolariztion with ST / T ratio less than 0.25.

Acute pericarditis with ST / T ratio greater than 0.25.



A. B. C.

ems12lead.com

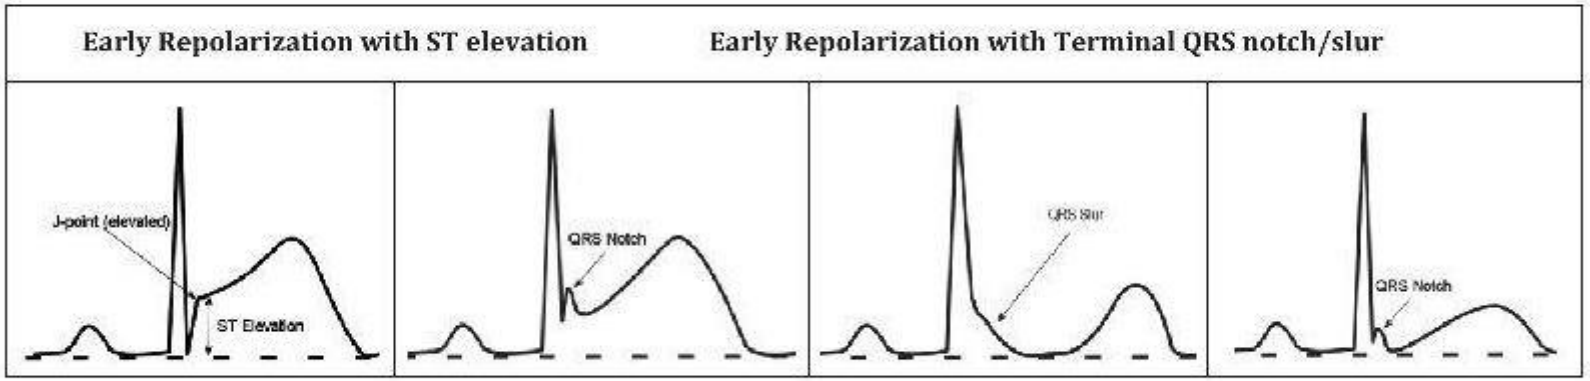


Figure 1. Examples of early repolarization pattern.

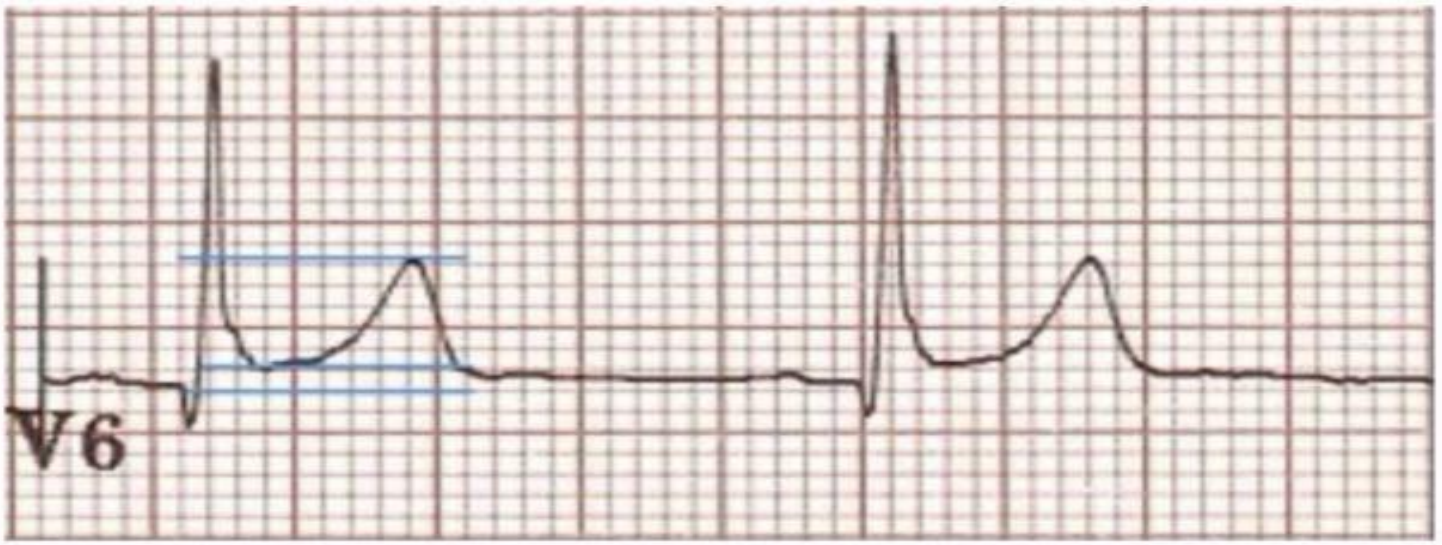
Example 1: Benign Early Repolarisation



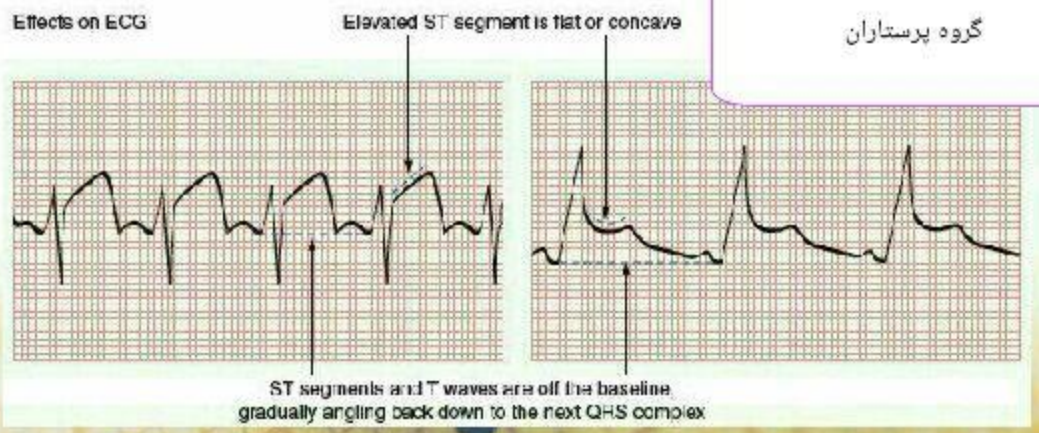
- ST segment height = 1 mm
- T wave height = 6 mm
- ST / T wave ratio = 0.16
- The ST / T wave ratio < 0.25 is consistent with BER.

Indicative Lead Groups

- Inferior Wall - II, III, and aVF
- Septal Wall - V1, V2
- Anterior Wall - V3, V4
- Lateral Wall - V5, V6, I, and aVL

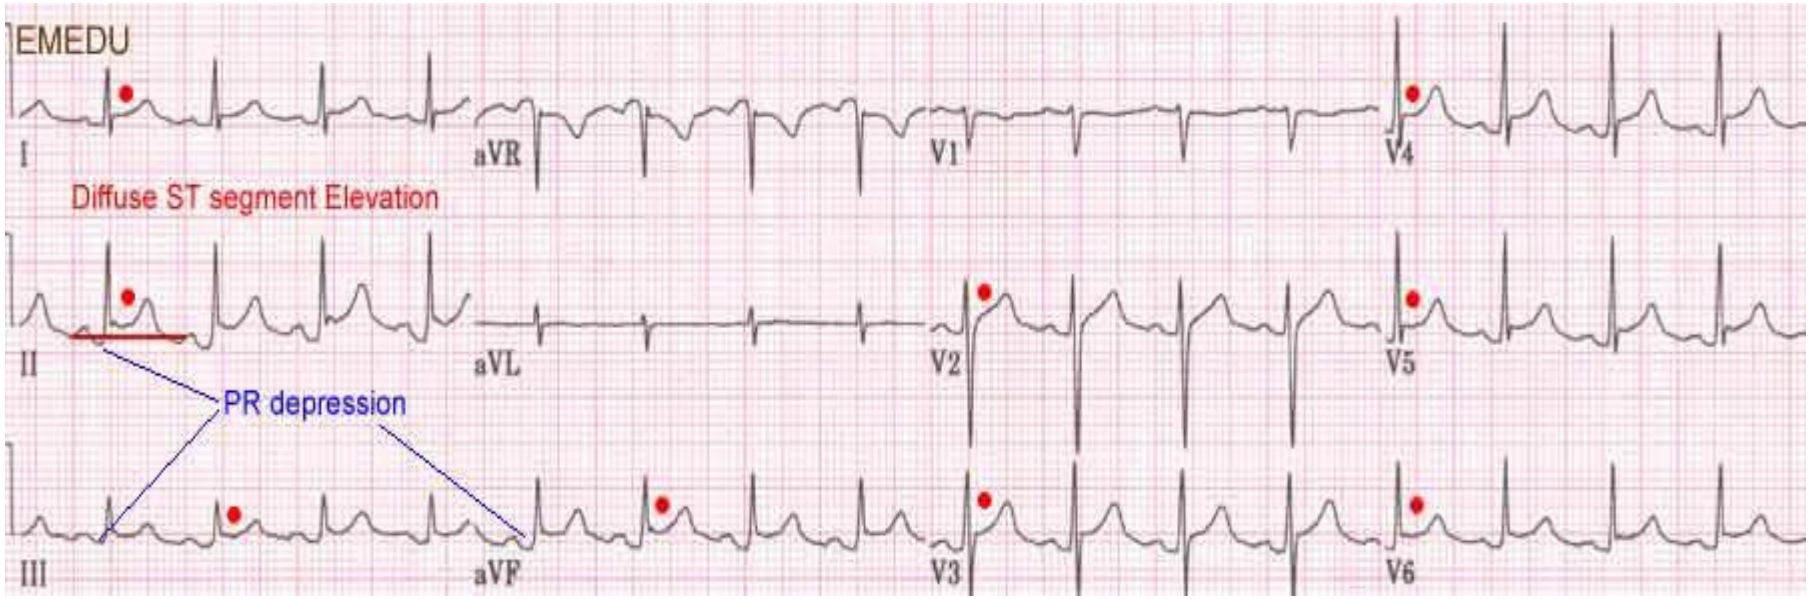
ECG Changes in Pericarditis

- T wave initially upright and elevated but then during recovery phase it inverts
- ST segment elevated and usually flat or concave



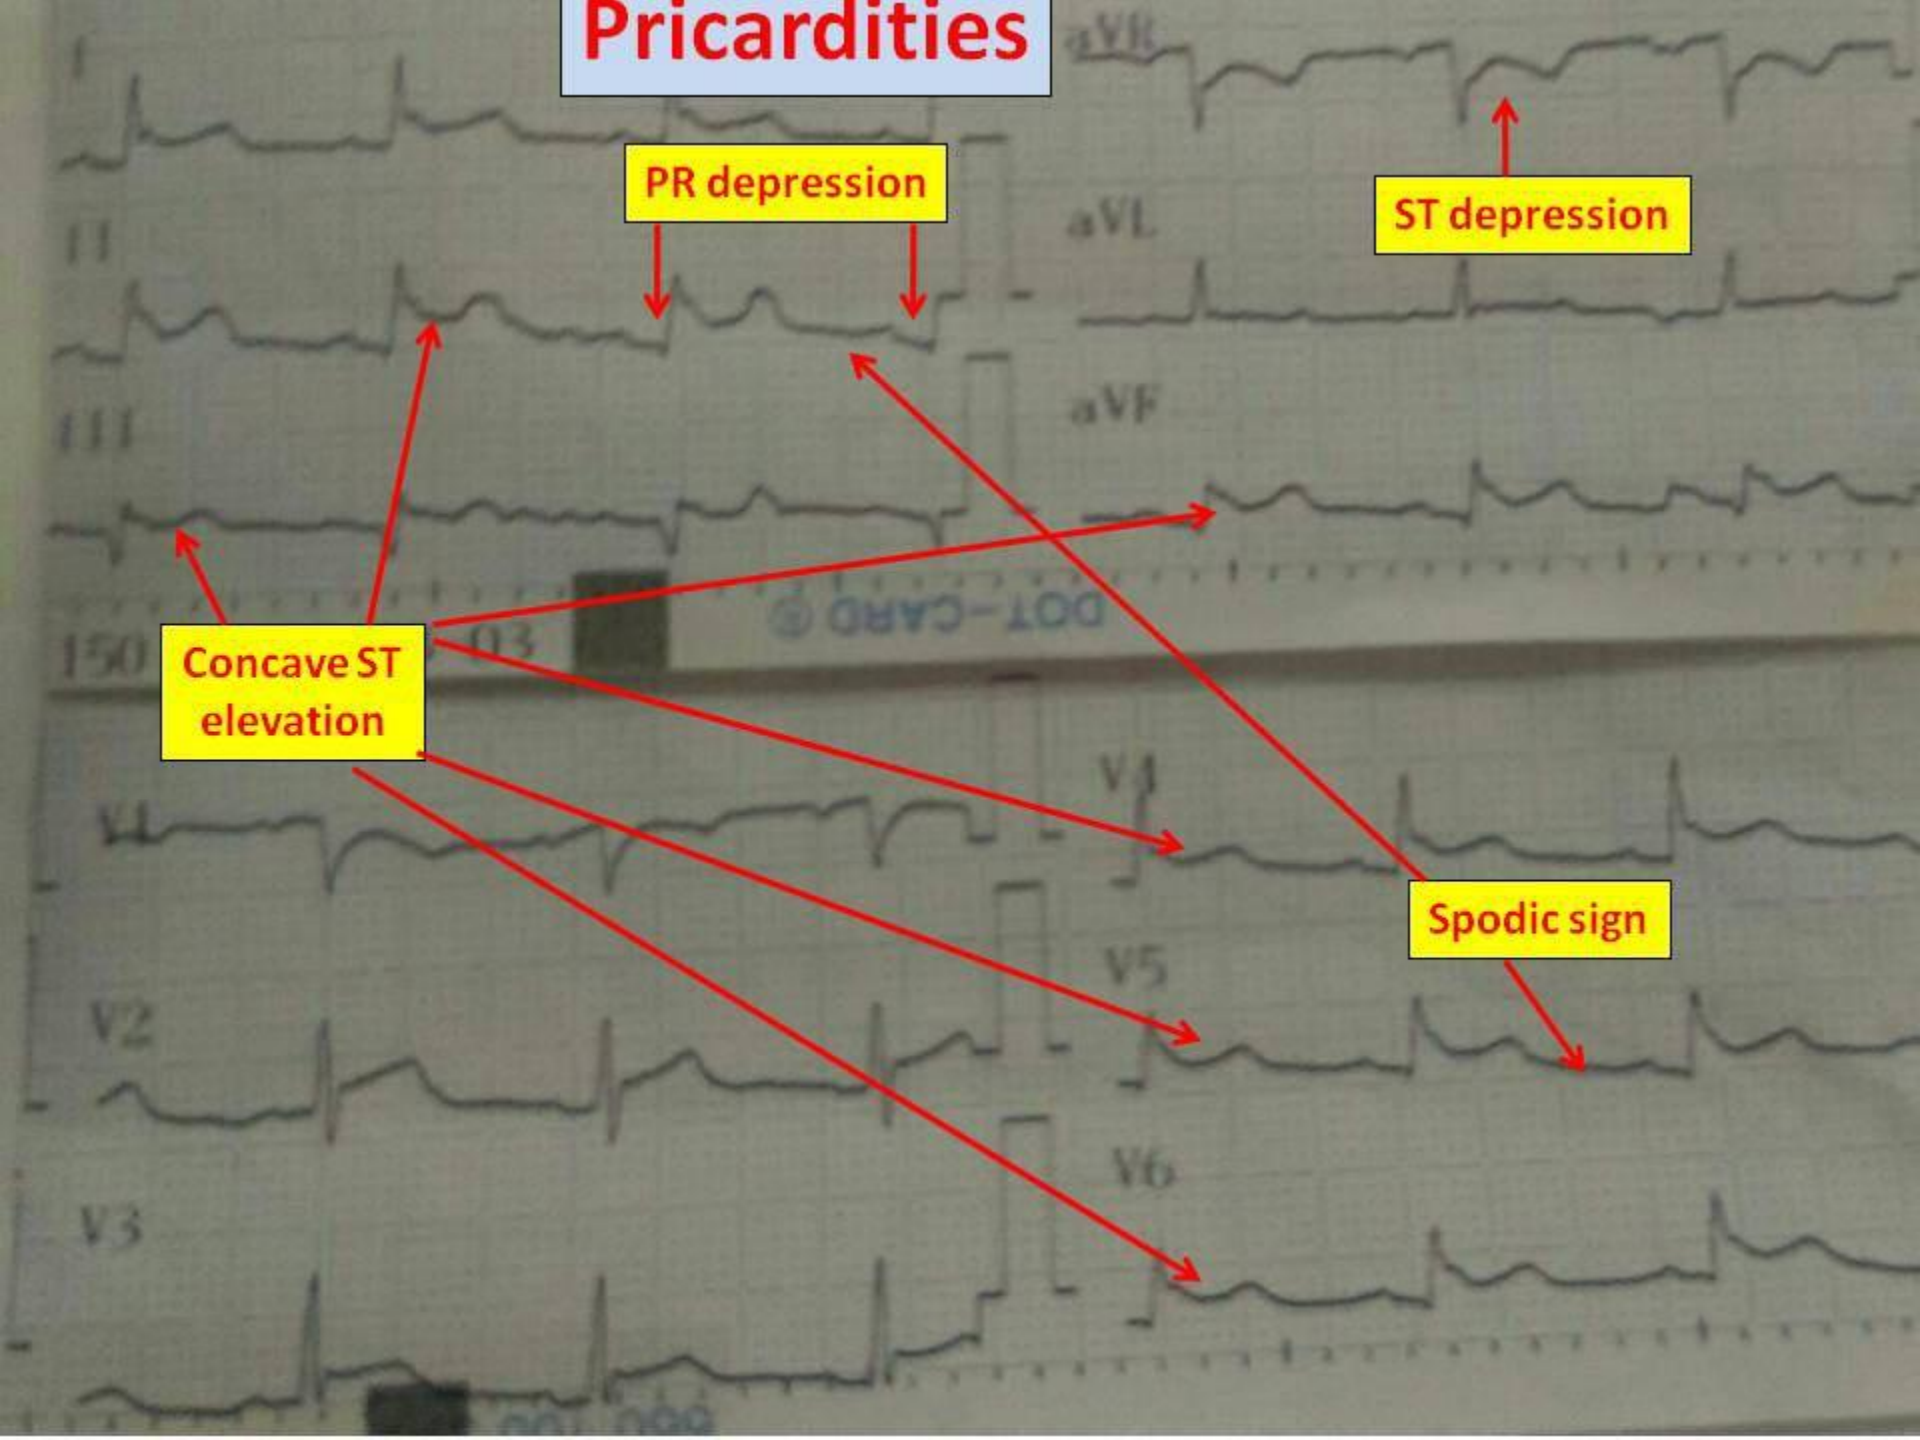
گروه پرستاران

Pericarditis



Concave-up ST elevation

PR segment depression



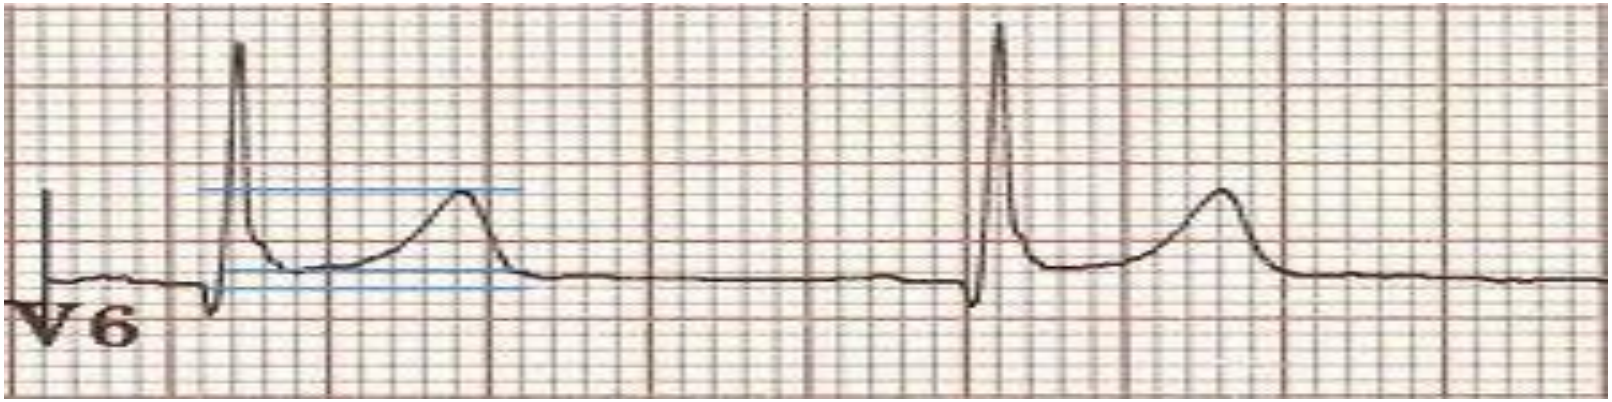
Pricardities
PR depression
ST depression
Concave ST elevation
Spodic sign

Differenitation Between Pericarditis & Early Repolarization

!The vertical height of the ST segment elevation (from the end of the PR segment to the J point) is measured and compared to the amplitude of the T wave in V6.

- A ratio of > 0.25 suggests pericarditis
- A ratio of < 0.25 suggests BER

ST segment height = 1 mm
T wave height = 6 mm
ST / T wave ratio = 0.16
The ST / T wave ratio < 0.25 is consistent with BER.

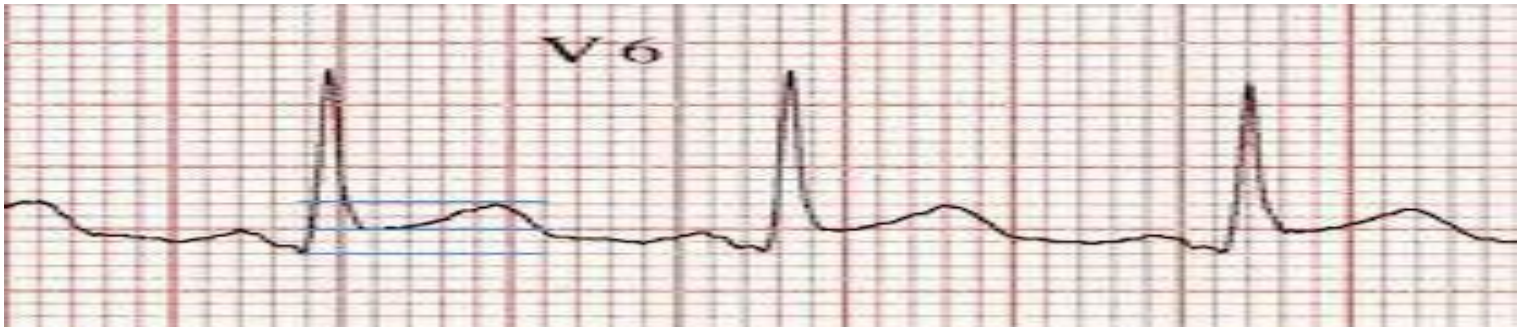


ST segment height = 2 mm

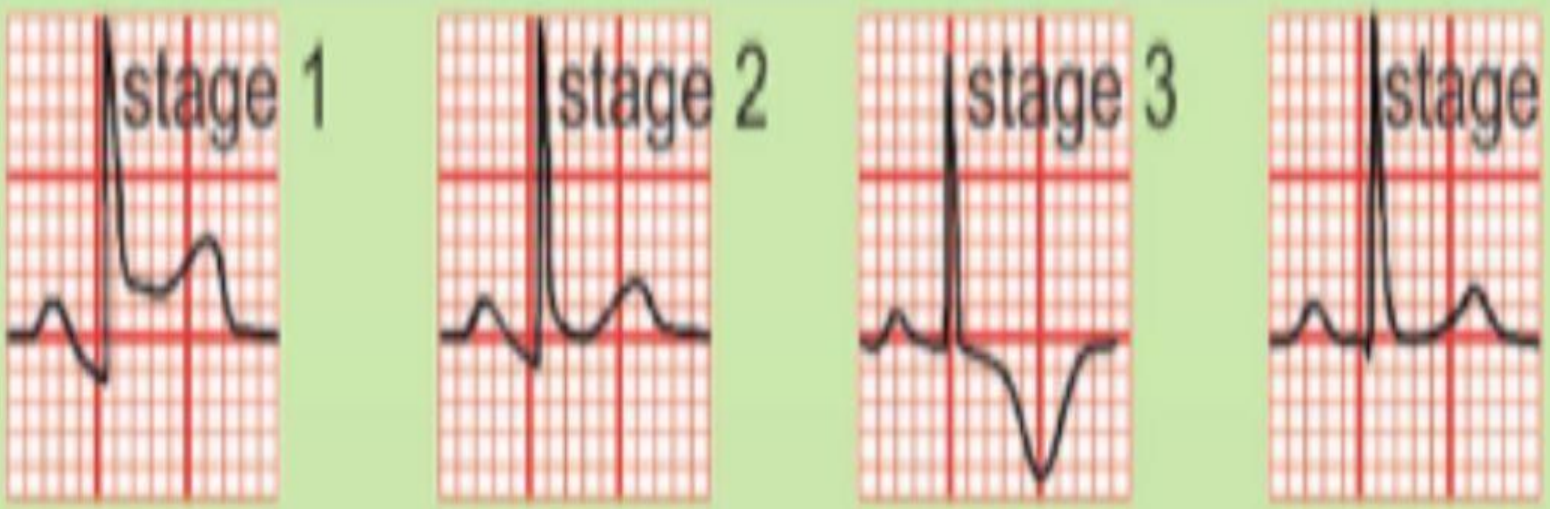
T wave height = 4 mm

ST / T wave ratio = 0.5

The ST / T wave ratio > 0.25 is consistent with pericarditis.

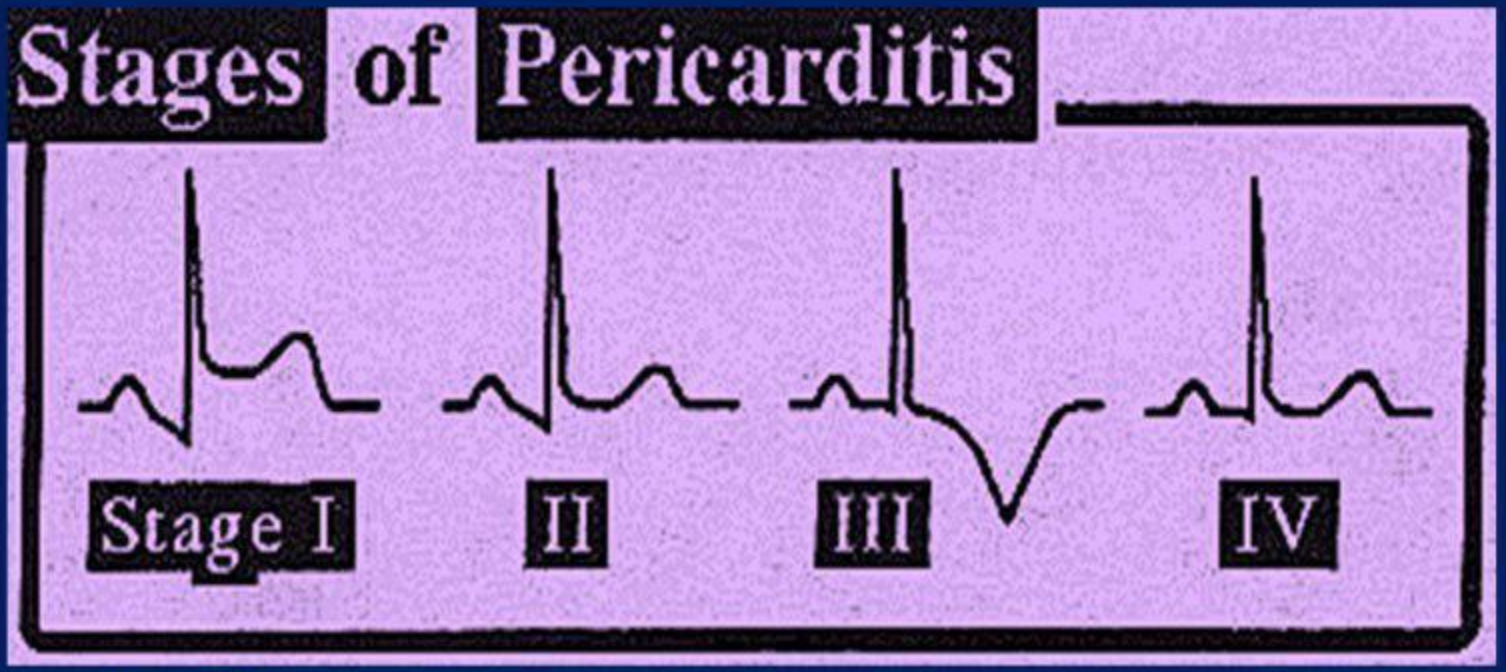


پریکاردیت Pericarditis



مشخصات : قطعه ST به شکل کفه‌ای بالا رفته و فاصله P تا Q دپرس می شود، سپس یکبار طبیعی شدن، بعد منفی شدن T و نهایتاً طبیعی شدن کلی شکل می گیرد.

Stages of Pericarditis



- **Stage I**
  everything is UP (i.e., ST elevation in almost all leads - see below)
- **Stage II**
  Transition (i.e., "pseudonormalization").
- **Stage III**
  Everything is DOWN (inverted T waves).
- **Stage IV**
  Normalization

Wide QRS tachycardia

- **Features for differentiation :**

- History and physical examination:

1. Previous MI , angina , CHF – have 95% for diagnosing **VT**
2. Pts with VT are older than **SVT-A** (> 35 yrs)
3. **SVT-A** often have previous episode(>3years)
4. Pts with **SVT-A** are hemodynamic stable.
5. Termination of WCT with physical manoeuvres and medications

Wide QRS tachycardia

1. **QRS duration :**

- > 160 ms with LBBB , >140 ms with RBBB - **VT**

Exceptions:

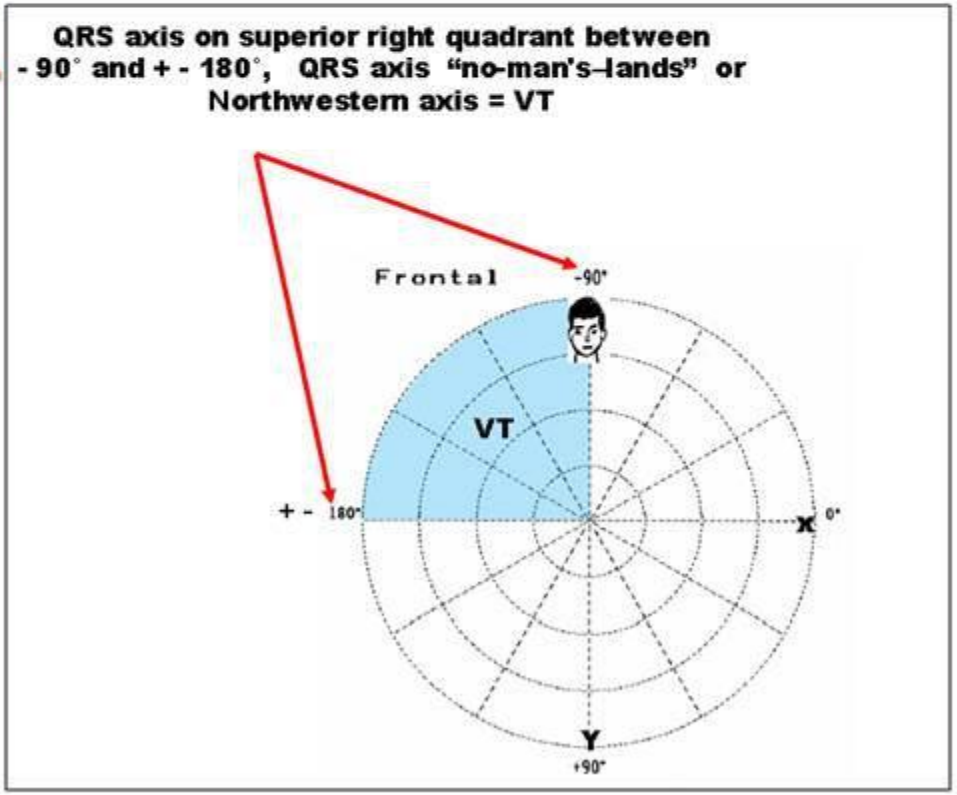
a. Anti arrythmitic drugs non specifically prolong QRS duration.
b. Pts with structurally normal heart may have VT with QRS duration of 120-140ms.(<140ms in12% , < 120 ms in 4%)
c. QRS duration also depend site of origin of VT , septal VT

QRS duration has sensitivity of 70%

Wide QRS tachycardia

2. QRS axis :

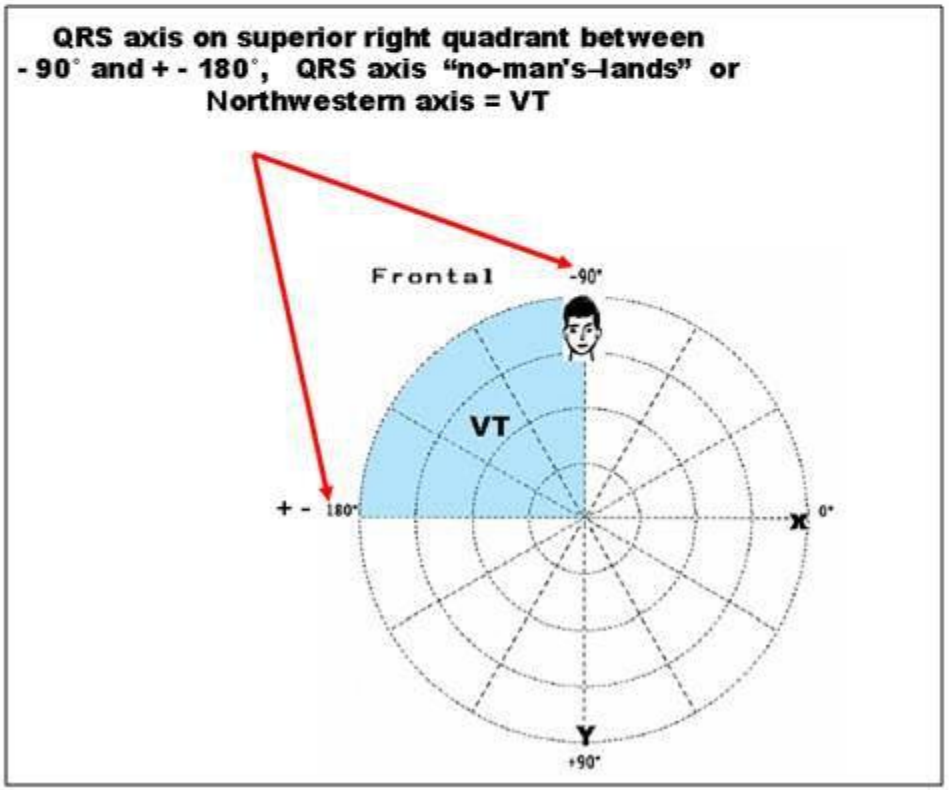
- Frontal plane axis of -90 to +180 --- **VT**
- RBBB with LAD --- **VT**
- LBBB with RAD --- **VT**



Wide QRS tachycardia

3. Concordant QRS in limb leads :

- The presence of predominantly negative QRS complexes in leads I,II,III is suggestive of **VT**
- Highly specific for **VT**

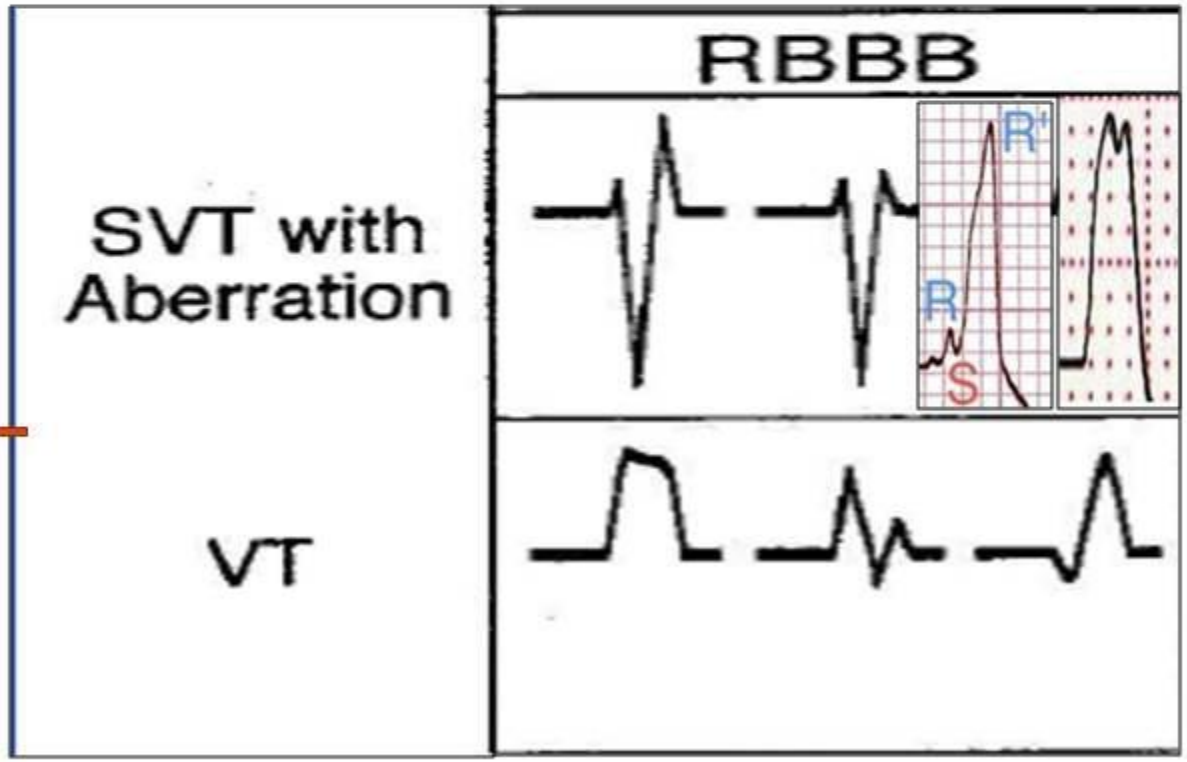


Wide QRS tachycardia

5. RBBB – V1 :

- rSR,rSr , rR , rsr patterns consistent ---- **SVT**
- R>30ms with any negative QRS , qR --- **VT**

Sensitivity – 30-80%
Specificity - 84-95%

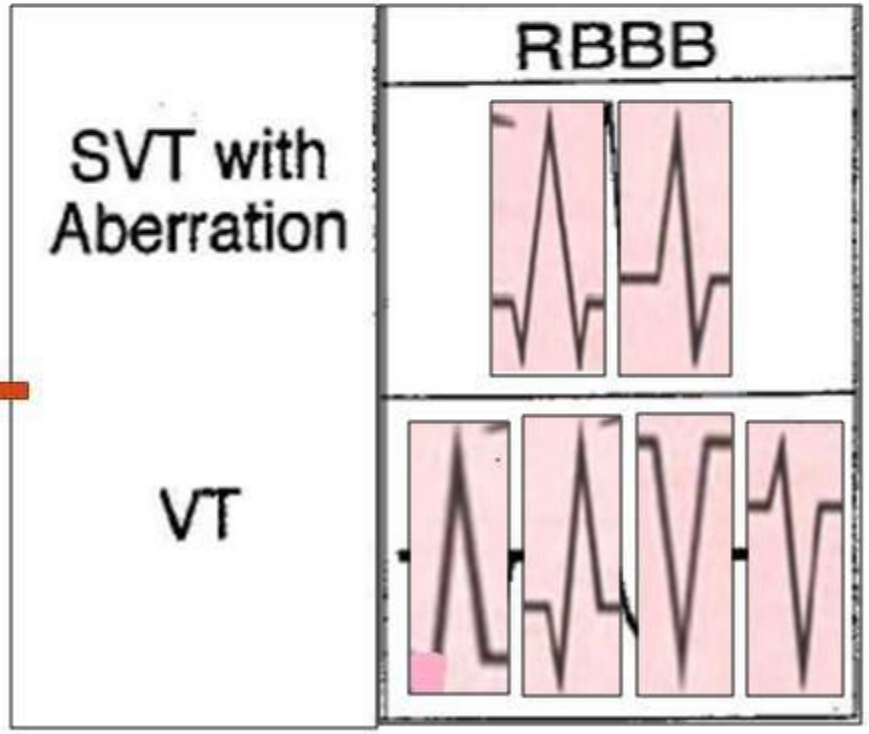


Wide QRS tachycardia

5. RBBB – V6 :

- qRs , Rs , R/S >1 --- **SVT–A**
- R , QR , QS , R/S < 1 --- **VT**

Sensitivity – 30-60%
Specificity - 80-100%



Wide QRS tachycardia

6. Q wave presence :

- Q during WCT --- suggest old MI --- **VT most likely**.

Exceptions :

1. Pts with DCMP will have Q wave during VT that are not present during baseline.
2. PSEUDO Q wave with retrograde p wave deforming QRS can be seen in SVT-A
3. Preexcited tachycardia with posterior AV connection can have Q wave in inferior leads

Wide QRS tachycardia

7. AV dissociation :

- The most specific ECG finding for **VT** .
- Clues for AV dissociation:

1. Clinically by cannon A waves , variable intensity of S1 , Variation in SBP unrelated to respiration.
2. AV dissociation
3. AV ratio of less than 1
4. 2:1 VA block(d/t retrograde conduction)
5. Variation in QRS amplitude during WCT
6. Fusion & capture beats
7. Recording separate atrial electro gram (oesophageal/transvenous)
8. Echo (evaluating RA contraction in relation to ventricular)

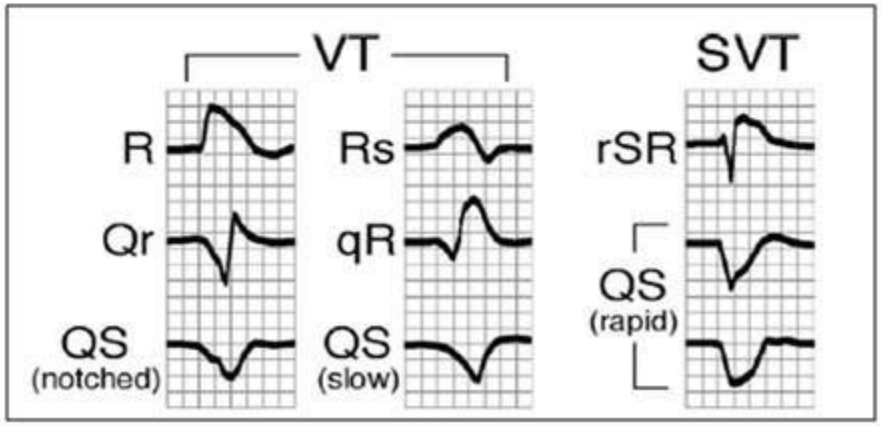
Wide QRS tachycardia

9. AVR changes :

1. initial '**r**' wave in **AVR**
2. initial '**r**' or '**q**' wave of > 40ms duration
3. **notch** in descending limb of negative onset and predominantly negative QRS
4. Vi/Vt ≤ 1

All the above features are indicative of VT

Sensitivity – 96.7%
Specificity – 99%

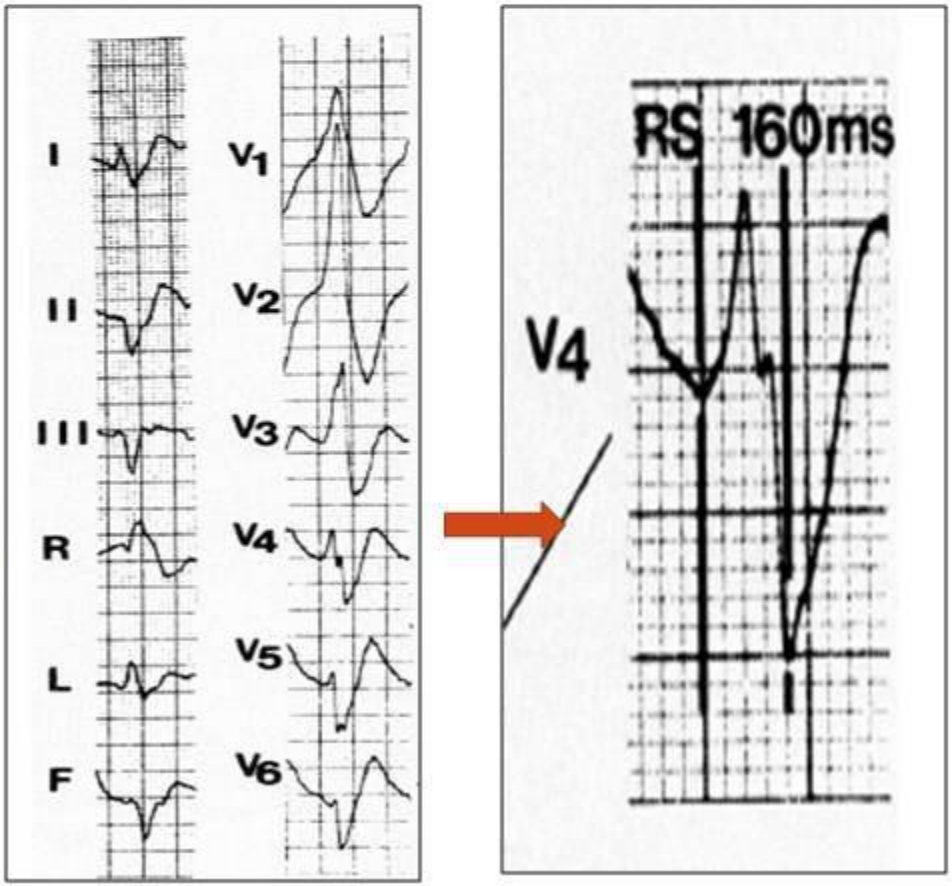


Wide QRS tachycardia

4. Pericordial RS duration criteria :

- If concordant QRS complexes are absent with RS complex (**R wave to nadir of S wave** > 100 ms).----**VT**

Sensitivity – 66%
Specificity - 98%



Wide QRS tachycardia

3. Concordant QRS in chest leads:

- Concordant QRS in chest leads is diagnostic of **VT** uncommon in SVT-A.
- Exceptions:
  - Positive concordance (ventricular activation begins left posteriorly) seen in VT originating in Lt post wall or SVT using a left posterior accessory pathway for AV conduction.
  - If no additional criteria for WPW are absent don't consider it because of low incidence(<6%)

Specificity of 90%, Sensitivity of 20%

Wide QRS tachycardia

7. AV dissociation :

- The most specific ECG finding for **VT** .
- Clues for AV dissociation:

1. Clinically by cannon A waves , variable intensity of S1 , Variation in SBP unrelated to respiration.
2. AV dissociation
3. AV ratio of less than 1
4. 2:1 VA block(d/t retrograde conduction)
5. Variation in QRS amplitude during WCT
6. Fusion & capture beats
7. Recording separate atrial electro gram (oesophageal/transvenous)
8. Echo (evaluating RA contraction in relation to ventricular)

Wide QRS tachycardia

6. Q wave presence :

- Q during WCT --- suggest old MI --- **VT most likely**.

Exceptions :

1. Pts with DCMP will have Q wave during VT that are not present during baseline.
2. PSEUDO Q wave with retrograde p wave deforming QRS can be seen in SVT-A
3. Preexcited tachycardia with posterior AV connection can have Q wave in inferior leads

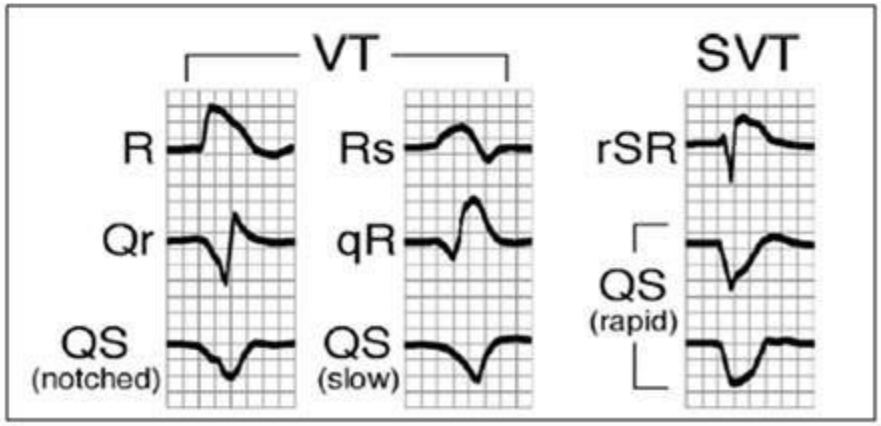
Wide QRS tachycardia

9. AVR changes :

1. initial '**r**' wave in **AVR**
2. initial '**r**' or '**q**' wave of > 40ms duration
3. **notch** in descending limb of negative onset and predominantly negative QRS
4. Vi/Vt ≤ 1

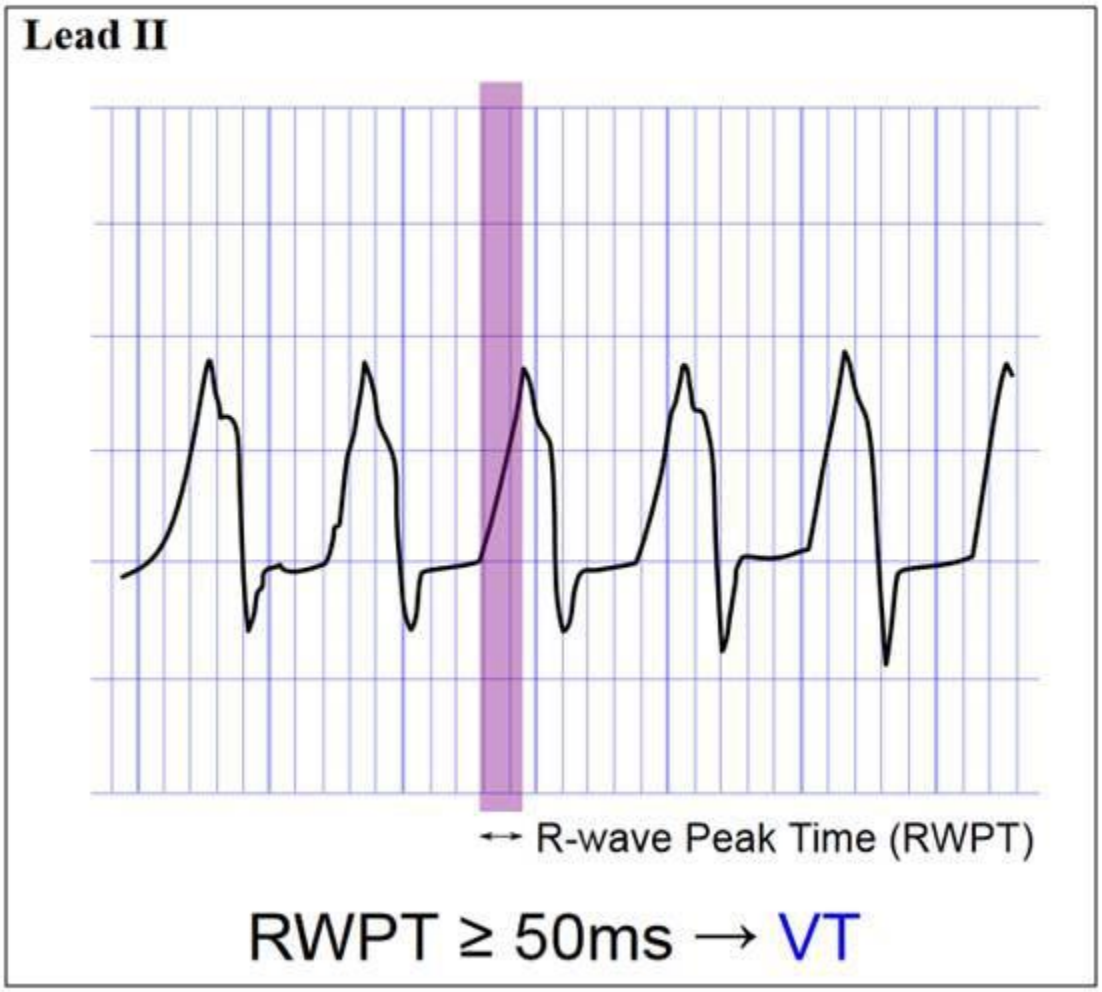
All the above features are indicative of VT

Sensitivity – 96.7%
Specificity – 99%



Wide QRS tachycardia

10. Lead II R-wave-peak-time (RWPT) criterion : Pavas criteria



RWPT > or =50 ms at DII is a **simple and highly sensitive** criterion that discriminates VT from SVT in patients with wide QRS complex tachycardia.

Sensitivity and specificity of 97%

MSSHERMEH@YAHOO.COM

Stable vs. Unstable Angina

Stable Angina	Unstable Angina
Episodic	Severe and of New onset
Crescendo - Decrescendo	Crescendo pattern
Occurs on exertion, relieved by rest	Occurs at rest
Lasts 2-5 mins	Lasts > 10 min

VARIANT ANGINA (VA)

- Temporary increase in coronary vascular tone (vasospasm) causing a marked, but transient reduction in luminal diameter[1]
- Patients are predominantly younger women[1]
- It has been associated with vasospastic disorders such as Raynaud's phenomenon and migraine headaches.[1]

1. Keller KB, Lemberg L. Prinzmetal's angina. Am J Crit Care. 2004;13(4):350-4

Subendocardial VS Transmural

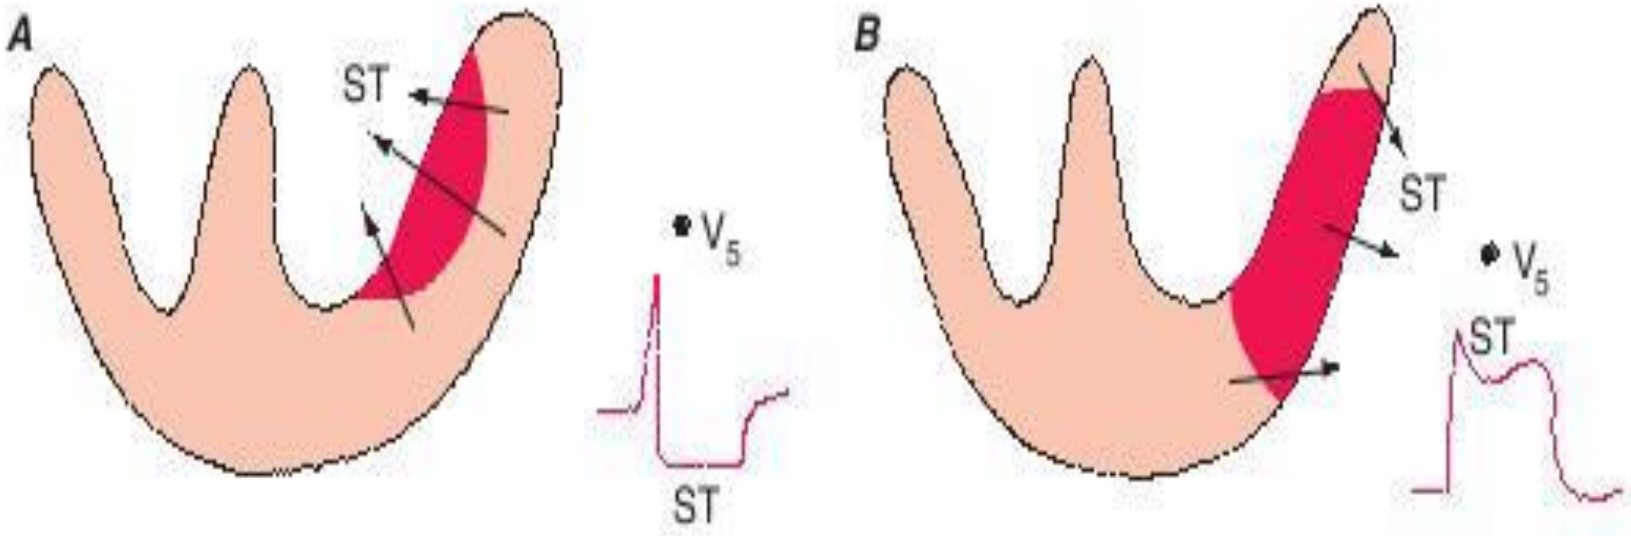

FIGURE 221-11 Acute ischemia causes a current of injury. With predominant subendocardial ischemia (***A***), the resultant ST vector will be directed toward the inner layer of the affected ventricle and the ventricular cavity. Overlying leads therefore will record ST depression. With ischemia involving the outer ventricular layer (***B***) (transmural or epicardial injury), the ST vector will be directed outward. Overlying leads will record ST elevation.

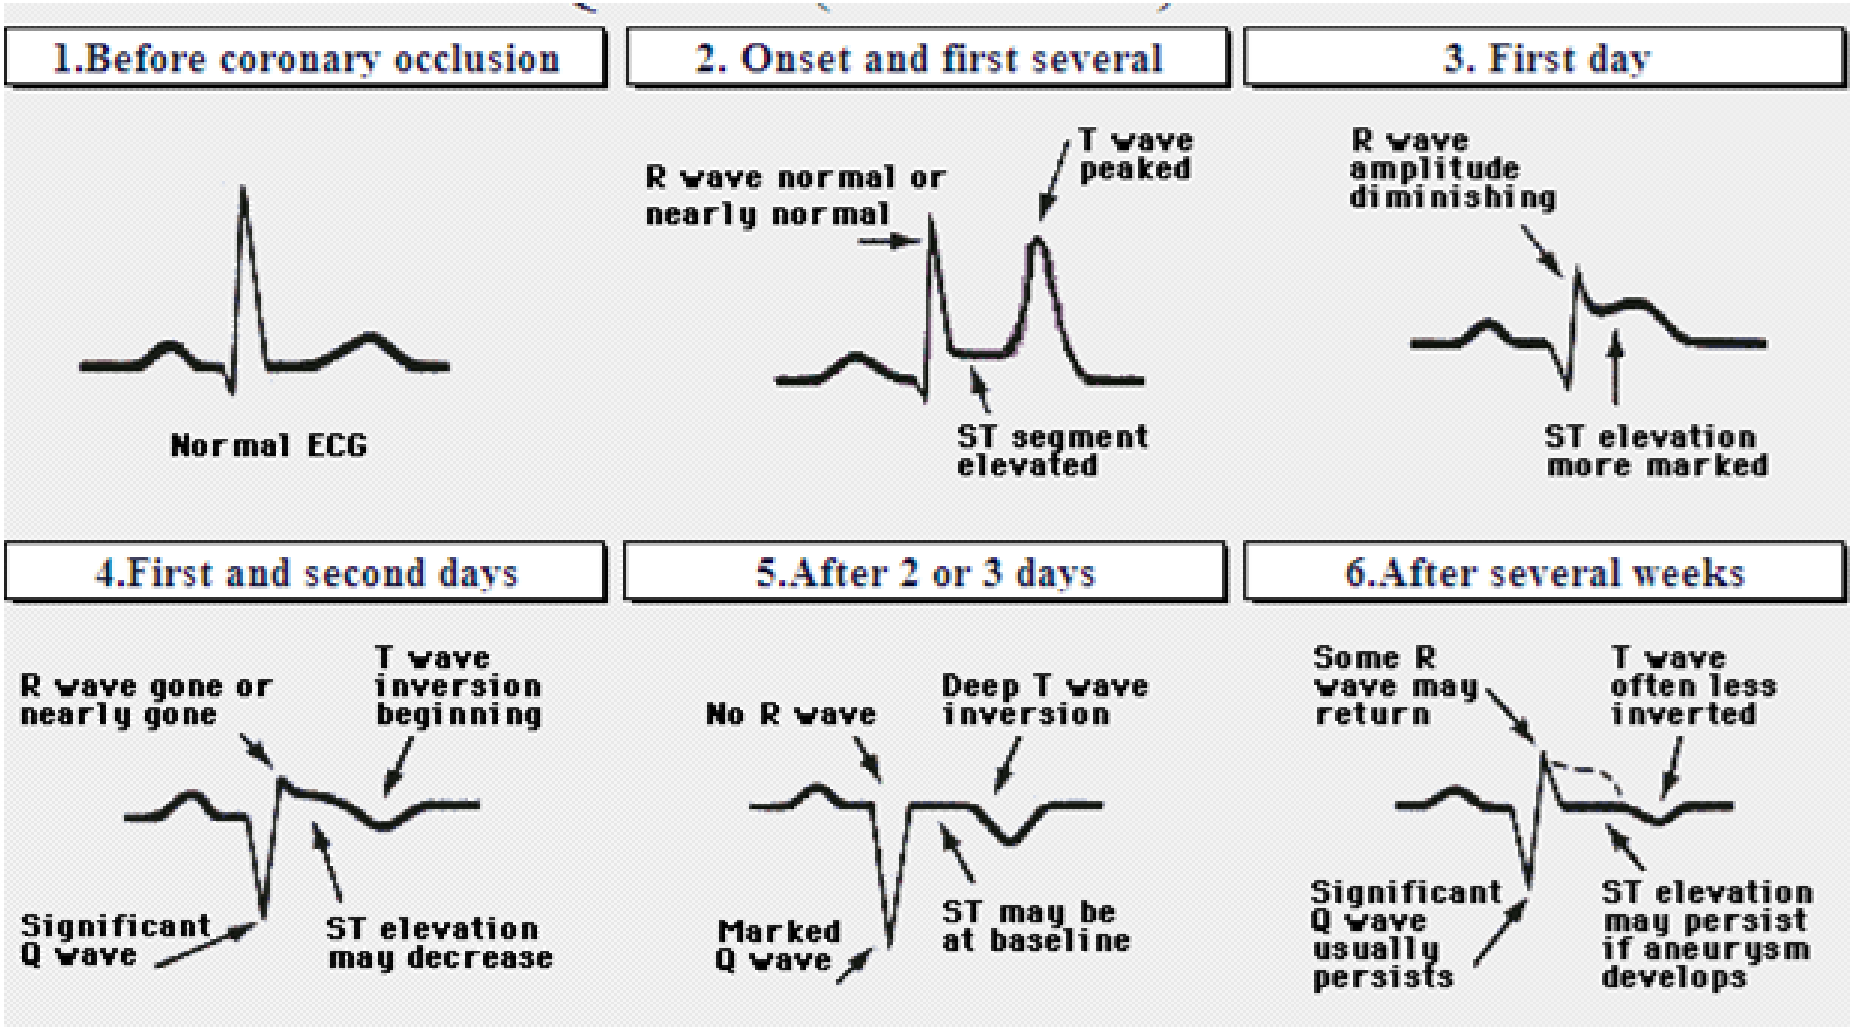
Serial ECG changes of MI



ST Segment Elevations

I. Myocardial ischemia/infarction
   A. Noninfarction, transmural ischemia (Prinzmetal's angina pattern)
   B. Acute myocardial infarction
   C. Post–myocardial infarction (ventricular aneurysm pattern)
II. Acute pericarditis
III. Normal variant ("early repolarization" pattern)
IV. Left ventricular hypertrophy (LVH)/left bundle branch block (LBBB) (V_1–V_2 or V_3 and other leads with QS or rS waves, only)
V. Brugada pattern (right bundle branch block (RBBB)–like pattern with ST elevations in right precordial leads)
VI. Other (rarer)
   A. Myocardial injury (non-infarction)
      1. Myocarditis (ECG may resemble myocardial infarction or pericarditis patterns)
      2. Tumor invading the left ventricle
      3. Trauma to the ventricles
   B. Hypothermia (J waves/Osborn waves)
   C. Hyperkalemia (usually localized to V_1 and V_2)

ST Segment Depressions

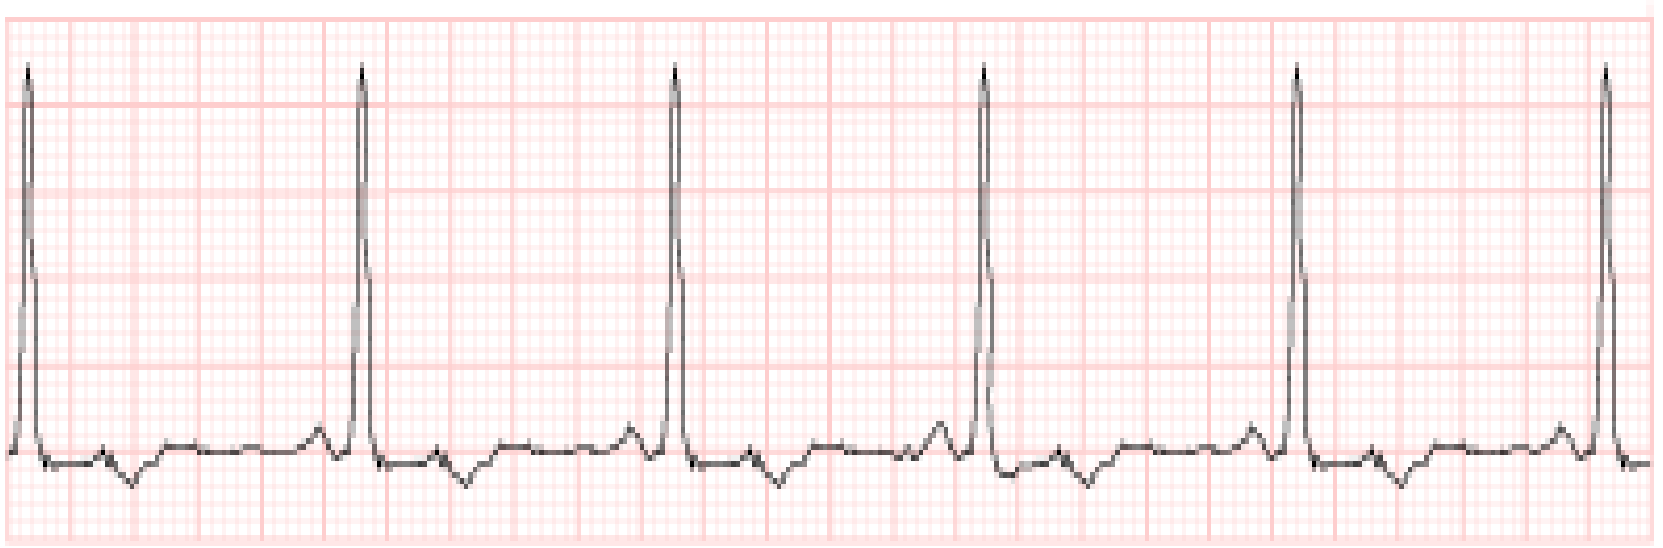
T Wave Inversion



- **Symmetrical & at least 2mm**
- **Ischemia: T Wave inversion**

Types of Angina

- Chronic Stable Angina – Dynamic occlusion + Micro vascular dysfunction – Progressive
- Micro vascular Angina – No flow limiting stenosis – Angio normal – less severe IHD
- Unstable Angina – Dynamic occlusion + Micro vascular dysfunction + Active Thromb
- Prinzemetal Angina – Occlusive spasm, No Micro vascular dys, No thrombus – ST ↑

Micro Vascular Angina

- Normal Coronary blood flow by angiogram
- No significant CAD in epicardial blood vessels
- Cardiac micro circulation is at fault
- Poor collateral connections – younger age
- More common in women – Syndrome X
- ECG or TMT show ST - T changes repeatedly
- Patient will be symptomatic for IHD

Unstable Angina

- Presence of one or more of the three features,
- Crescendo Angina- more severe, prolonged, or frequent. Decrease in exercise capacity
- New onset (1 month) & brought on by minimal exertion. Not relieved by Nitrates
- Angina at rest as well as with minimal exertion. There are 3 classes – 1 to 3
- This may progress to NSTEMI or STEMI

Prinzemetal Angina

- Transient ST-segment elevation during chest pain due to coronary vasospasm – variant angina
- ECG with ST ↑. Becomes normal soon, No Q wave
- Intermittent chest pain
  - – often repetitive, usually at rest, early morning
- Other vasospasms - syncope, Raynaud's, migraine
- βblockers contraindicated. CCB, α blockers Rx.

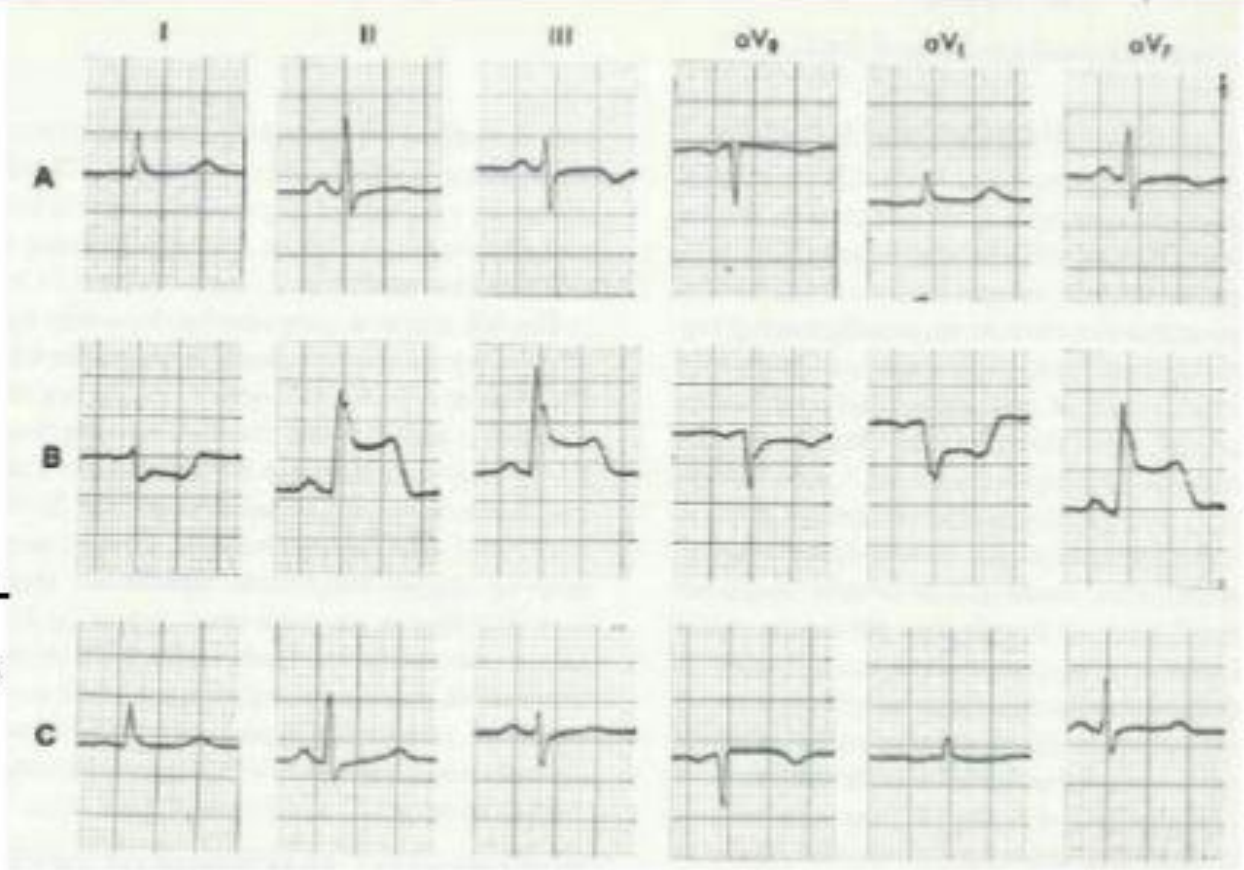
Prinzmetal's angina with transient ST elevation

Patient with history of exertional and rest angina

A. Baseline resting ECG shows non-specific inferior ST-T changes

B. With chest pain, ST elevations in II, III, aVF and reciprocal ST depression in I and aVL

C. Return of ST segments to baseline after nitroglycerin



Management of ACS

IHD type	Drug Rx.	Hep. /LMH	ICU Care	Lytic Rx	P PTCA
Stable Angina	A+B	No	No	No	No
Unstable Angina	A+B+C	Heparin	No / Yes	No	No
NSTEMI	A+B+C+G	LMH	YES	No	No
STEMI or QWMI	A+B+C+G	LMH	YES	YES	YES

A = Aspirin, B = Beta-blocker, C = Clopidogrel, G = GPIIb/IIIa Inhibitor

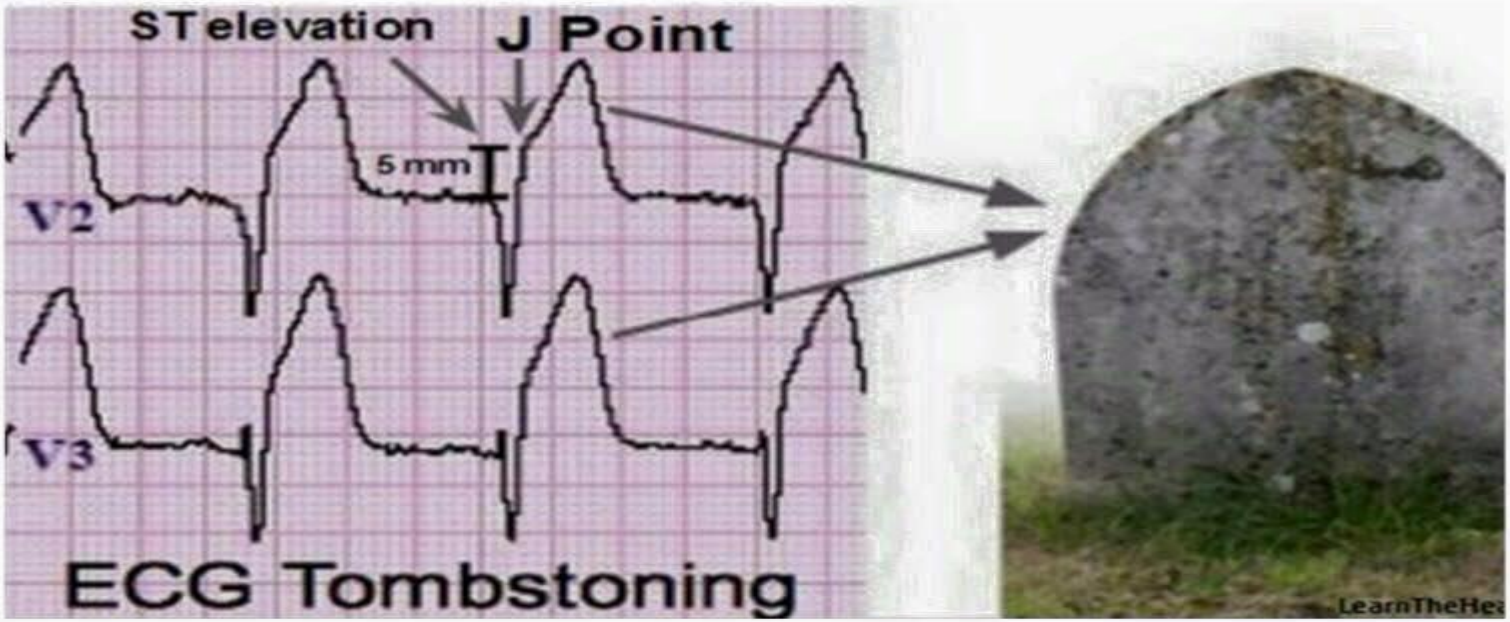
Interpretation/Localization:	**Acute Anteroseptal MI**



نشانه tombstone signe(سنگ قبر) چیست ؟

این نشانه در بیمارانی اطلاق می شود که دچار انفارکتوس و بدنبال آن RBBB شده اند یعنی اگر MI باعث RBBB شده باشه حتما MI extensive هست که به RBBB کشیده شده است و بیمار نخواهد توانست بهار سال آینده رو ببیند .

علائم بالینی انفارکتوس بطن راست

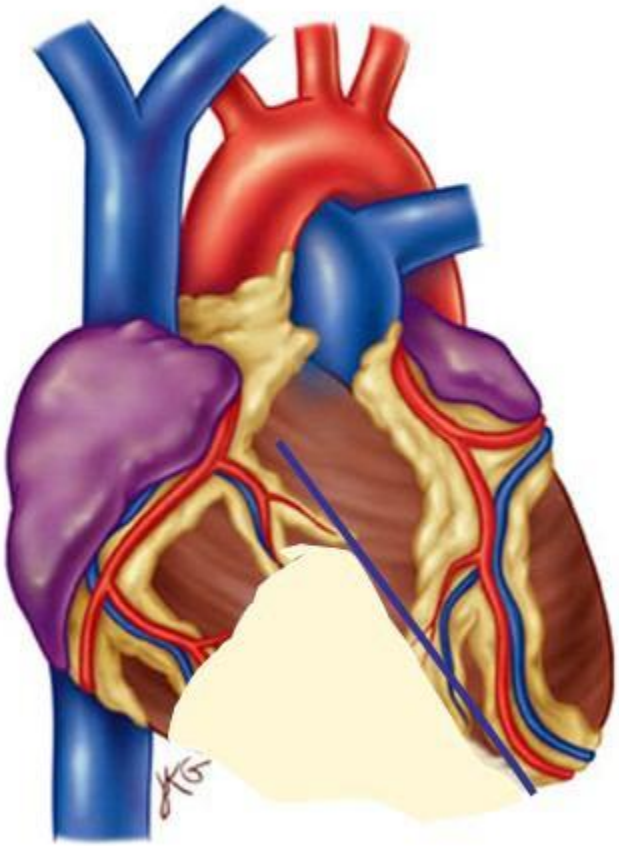
این علائم که پرستار باید دقیقا مراقب بروز آنها در بیمار باشد عبارتند از :

- اتساع ورید ژیگولار : در هنگام دم ، فشار ورید ژیگولار افزایش می یابد (علامت کاسمال) و ممکن است نبض پارادوکس ایجاد می شود .
- هپاتومگالی و ادم محیطی
- طولانی شدن صدای S2 در سمع و وجود گالوپ S3 و S4 بطن راست در ناحیه LSB به دلیل دیلاتاسیون و کاهش کمپلیانس بطن راست .
- سمع سوفل سیستولیک ناشی از نارسایی تریکوسپید در LSB
- هایپوتانسیون به دلیل کاهش برونده قلب و بروز شوک کاردیوژنیک
- وجود پوست سرد و مرطوب همراه با سیانوز
- اولیگوری
- تغییر در سطح هوشیاری

RV infarction

- STE >1mm V3R and V4R
- STE V1 > V2
- High degree AV block

Clinical Triad of RVI



- Hypotension
- Jugular vein distention
- Dry lung sounds

اقدامات درمانی اورژانس هنگام بروز انفارکتوس بطن راست

هدف از این اقدامات از بین بردن علائم نارسایی پمپ خون توسط بطن راست است این اقدامات عبارتند از :

- تجویز سرم نرمال سالین به میزان ۲۰۰ml/h به منظور فرستادن حجم خون کافی به طرف قلب چپ و دستیابی به حداکثر پیش بار .
- مانیتورینگ فشار وج مویرگهای ریوی (PCWP) جهت کنترل حجم مایع انفوزیون شده و پیشگیری از صدمه به دهلیز چپ . بدین منظور باید فشار وج کاپیلرهای ریوی بین ۱۸ – ۱۵ میلی متر جیوه حفظ شود و هرگز از ۲۰ میلی متر جیوه تجاوز نکند .
- تجویز دارو های اینوتروپ مثبت نظیر دوپامین و دوبوتامین . **دوپامین** با دوز ۲-۵ µg/kg/min موجب دیلاتاسیون عروق کلیه و ایجاد دیورز می شود با دوز ۵-۱۰ µg/kg/min گیرنده های دوپامینرژیک را تحریک کرده ، قدرت انقباضی قلب را تقویت می کند و با دوز بالاتر از ۱۰ µg/kg/min موجب انقباض عروقی و تاکی کاردی می شود . در این میان به دلیل آنکه **دوبوتامین** با دوز ۲,۵-۱۰ µg/kg/ min بدون ایجاد انقباض عروقی شدید و تاکی کاردی ، همان اثر اینوتروپ را روی قلب دارد ، داروی انتخابی اول به حساب می آید .
- در صورت بروز هایپوتانسیون ، بلوک های قلبی و کاهش برون ده قلب ، می توان از پیس میکر موقت استفاده کرد .

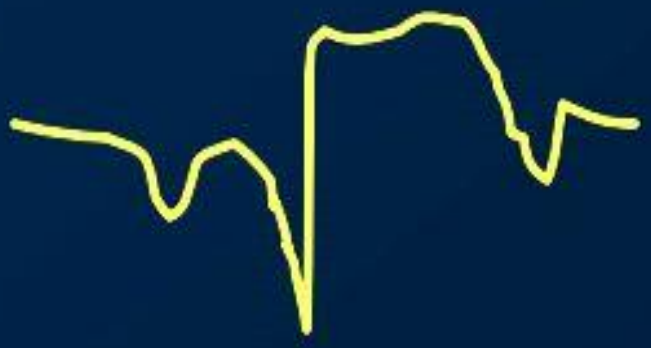
True PWMI

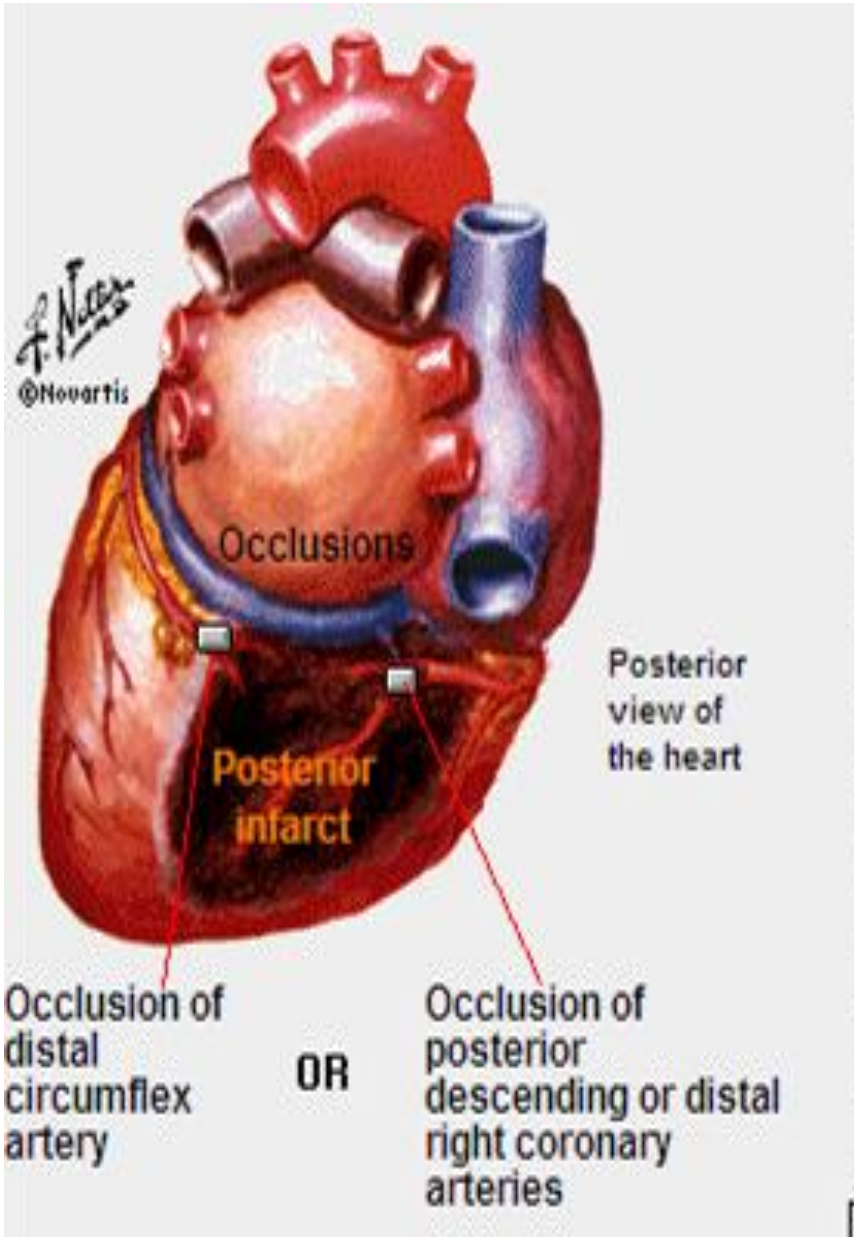
- ST depression in V1, R/S >1, and upright T wave

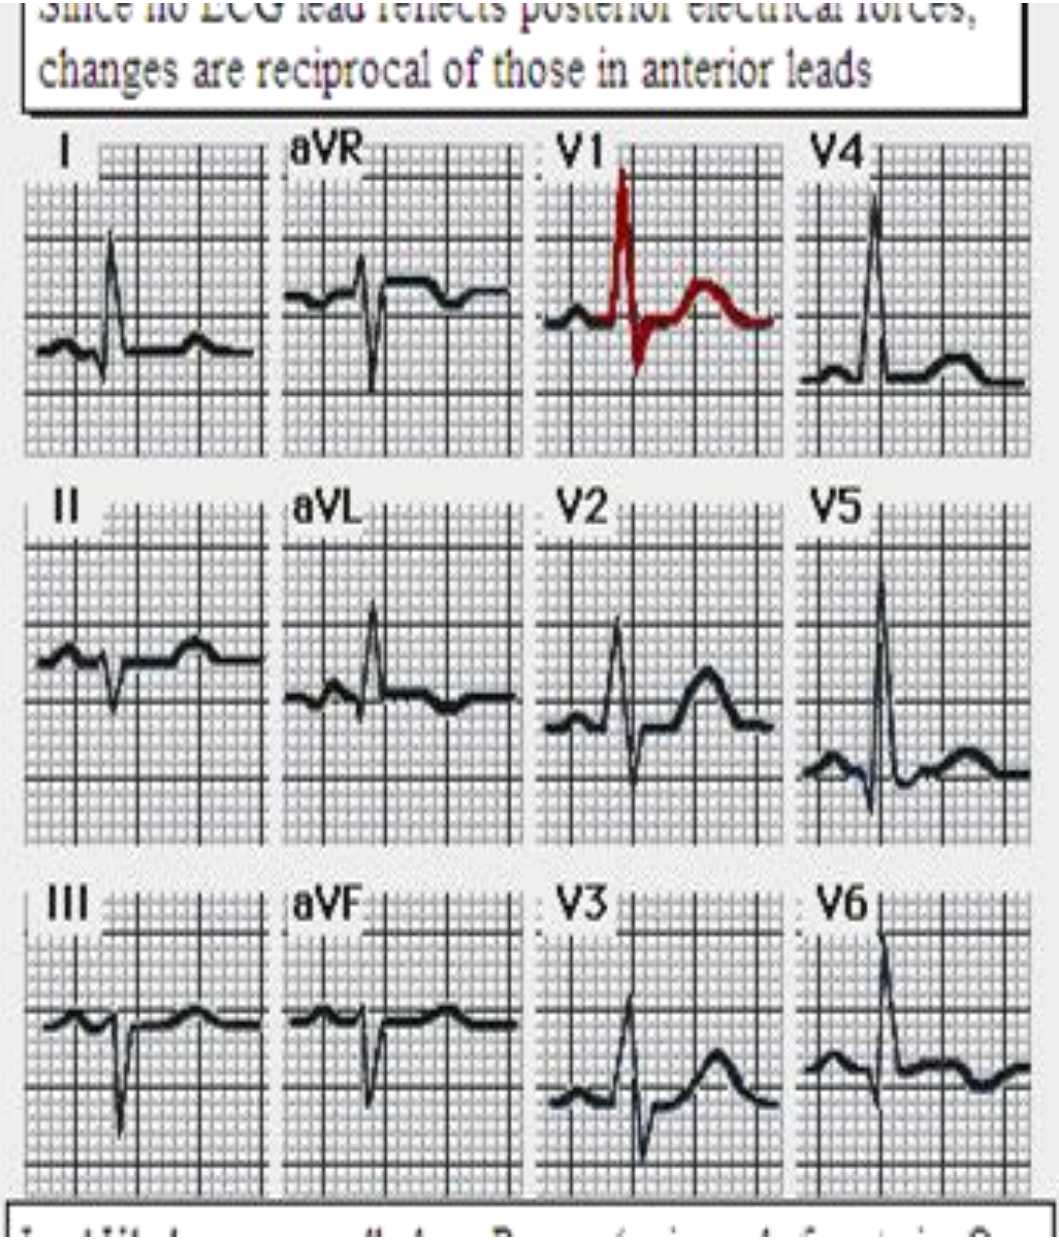
V1



V9

Acute True Posterior MI





Acute True Posterior MI

- Due to occlusion of the distal Left circumflex artery or posterior descending or distal right coronary artery
- Mirror image changes or reciprocal changes in the anterior precardial leads
- Lead V1 shows unusually tall R wave (it is the mirror image of deep Q)
- V1 R/S > 1, Differential Diagnosis - RVH

Acute True Posterior MI

- V2, V3 show tall R waves, Even V1 shows R
- V2, V3, V1 leads R/s ratio is >> 1
- These R waves are the mirrored MI – Qs
- These leads show deep ST depression
- This ST↓is in fact the mirrored ST↑of MI
- The same leads show sharp T waves
- These are the mirrored T inversions of MI

Inferio-Posterior MI

- V1, V2 show tall R waves
- V1, V2 leads R/s ratio is >> 1
- These R waves are the mirrored MI – Qs
- This ST↓ is in fact the mirrored ST ↑ of MI
- The T ↓are the mirrored T inversions of MI
- L2, L3 and aVF show gross ST ↑ - Inferior MI
- V4R, V5R show ST elevations – RV – MI too.

ST Elevation in aVR – LMCA occlusion?

This ECG demonstrates the classical pattern of left main coronary artery (LMCA) occlusion:

- **Widespread horizontal ST depression, most prominent in leads I, II and V4-6**
- **ST elevation in aVR ≥ 1mm**
- **ST elevation in aVR ≥ V1**

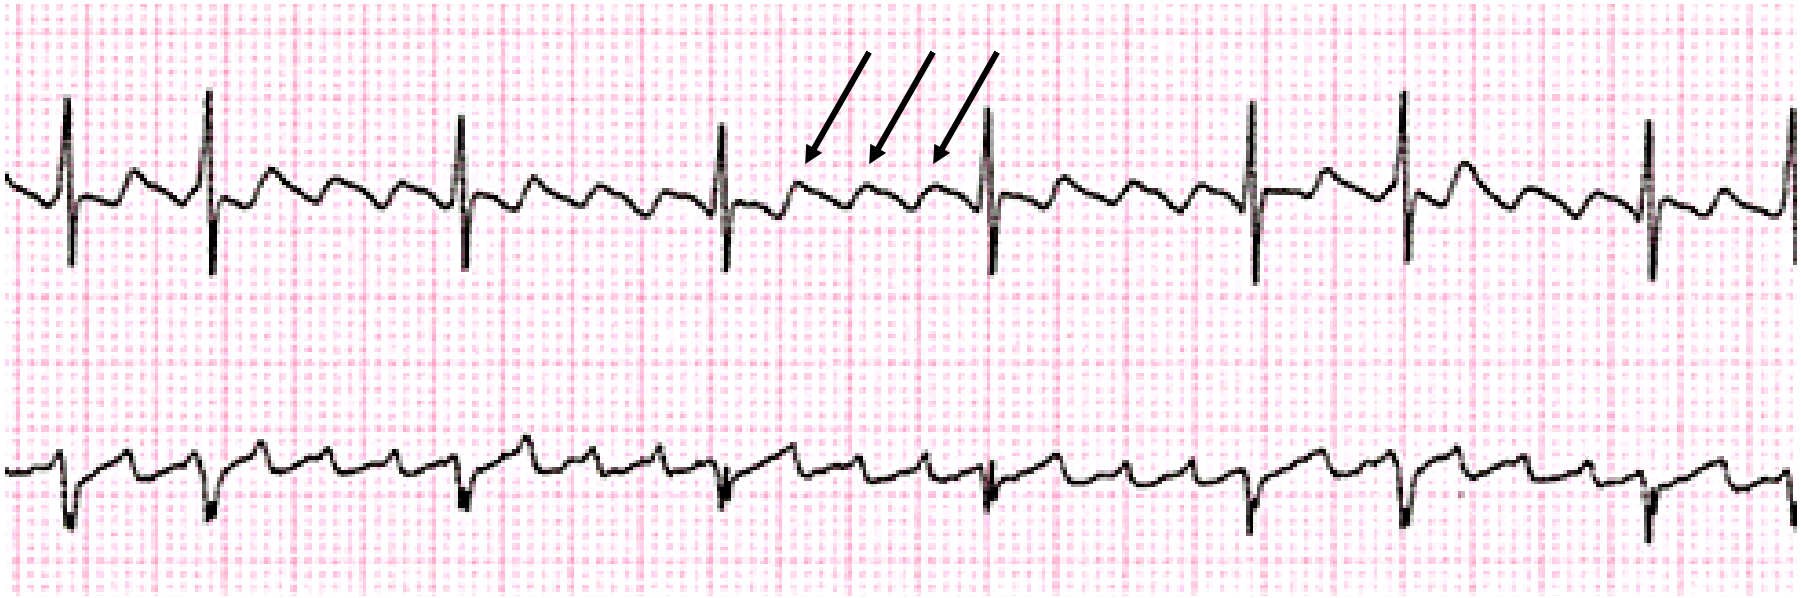
Atrial Flutter



Rhythm	P wave	PR interval	Heart rate QRS in sec
A: 220-430 bpm V: <300 bpm	Regular or variable	Sawtoothed appearance	N/A	<.12

Myxedema

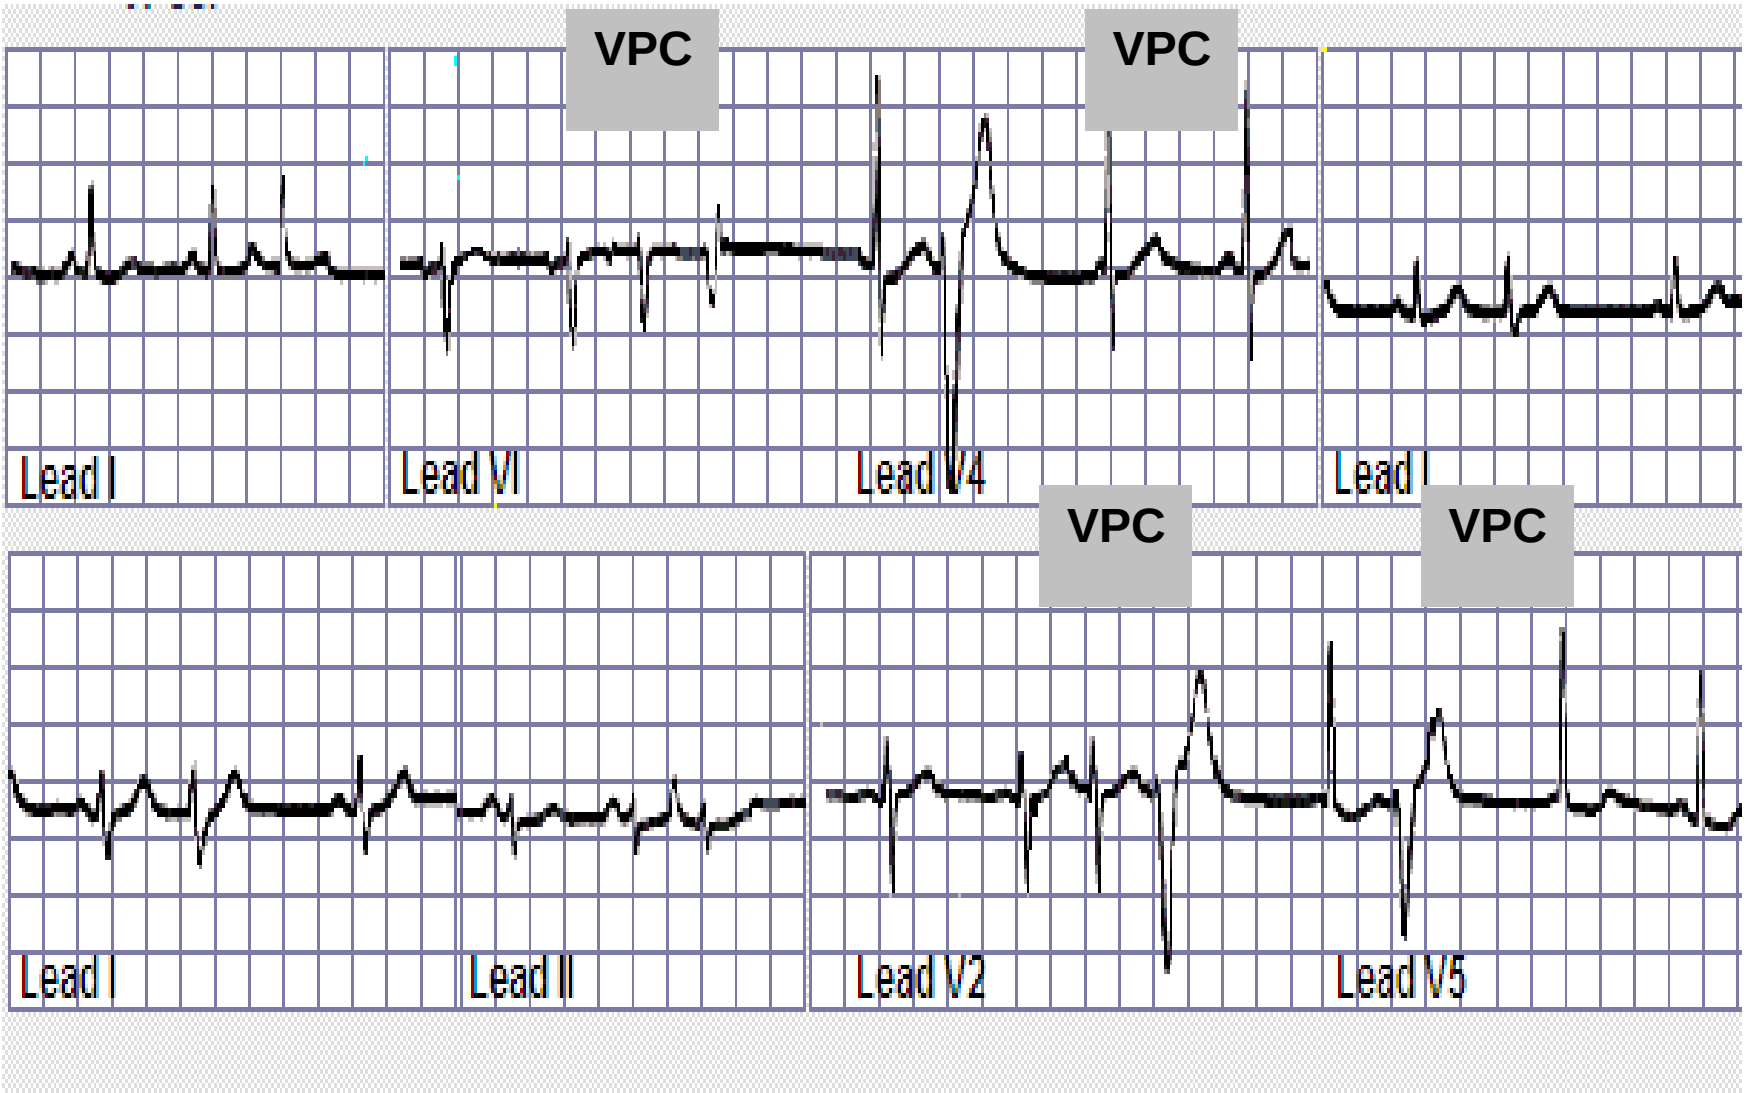
- Note the ECG changes
- Bradycardia – HR of 55 per minute
- Low voltages of all complexes
  - Less than 5 mm Limb leads
  - Less than 8 mm chest leads
- DD of low voltage complexes
- Pericardial effusion, Constrictive pericarditis
- Severe Emphysema
- Pneumothorax or left sided pleural effusion

Myxedema

Heart Rate	Rhythm	P Wave	PR interval (in seconds)	QRS (in seconds)
<60 bpm	Regular	Before each QRS, identical	.12 to .20	<.12

- Note ECG changes of Atrial Flutter
- The heart rate is regular or variable
- Atrial rate is 300 per minute
- All P waves are not conducted to ventricles
- The R-R intervals very depending on the AV conduction ratio
- The QRS is narrow – < 0.12 sec
- The P waves have a ‘saw toothed’ appearance called ‘F’ waves

Ventricular Ectopics



- Note the premature (ectopic) beats marked as VPC (Ventricular Premature Contractions)
- These occurred before the next expected QRS complex (premature)
- Each VPC has no definite P wave preceding the QRS of that beat – So impulse has originated in the ventricles
- The QRS complexes are wide with abnormal duration of > 0.12 and their shapes are bizarre

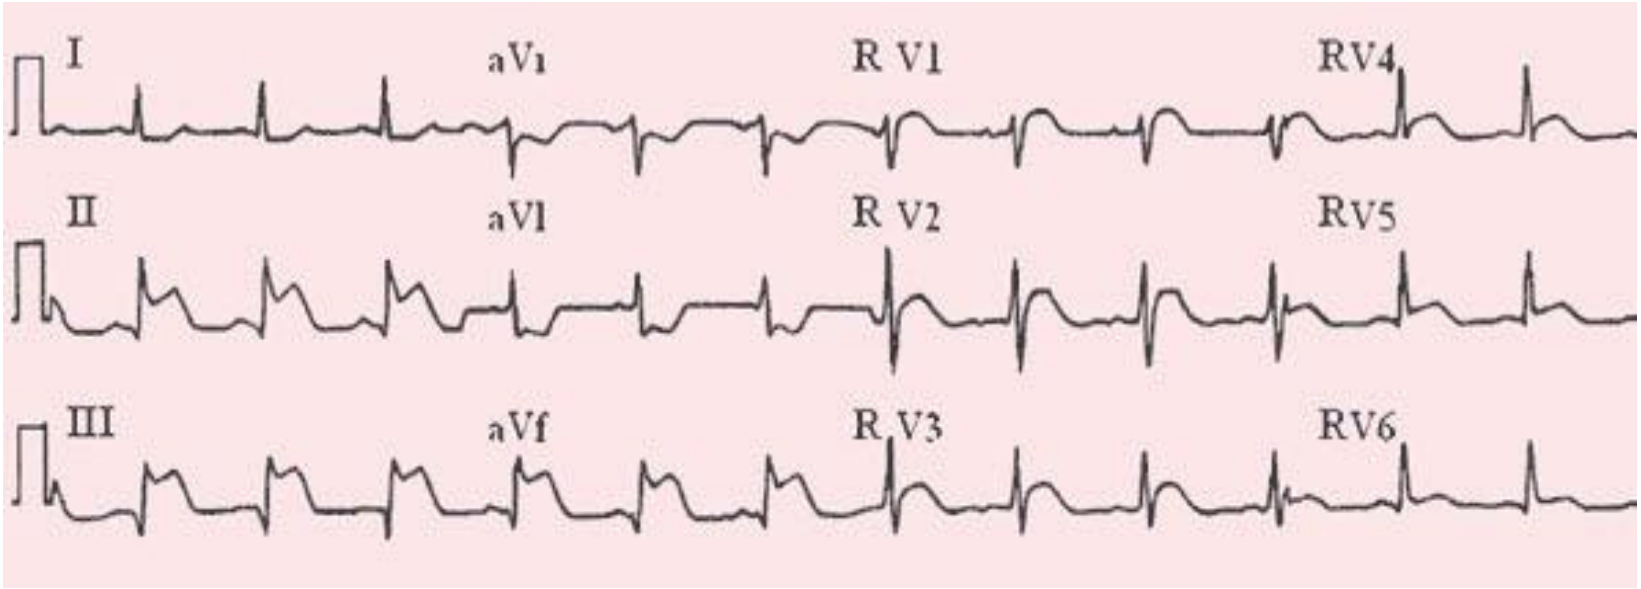
RV MI



with ST segment depression (Fig. 2.19). However, it may rarely be the sole abnormality. Figure 2.32 was recorded in a 50-year-old man with stable angina. It shows isolated U wave inversion in leads V_2 and V_3. Subsequent coronary angiography showed critical stenosis of the proximal left anterior descending artery. In ischaemic heart disease patients showing U wave inversion in the mid- or left praecordial leads, the coronary arteries which are stenosed are nearly always **the left main coronary artery or the left anterior descending artery**.[11]

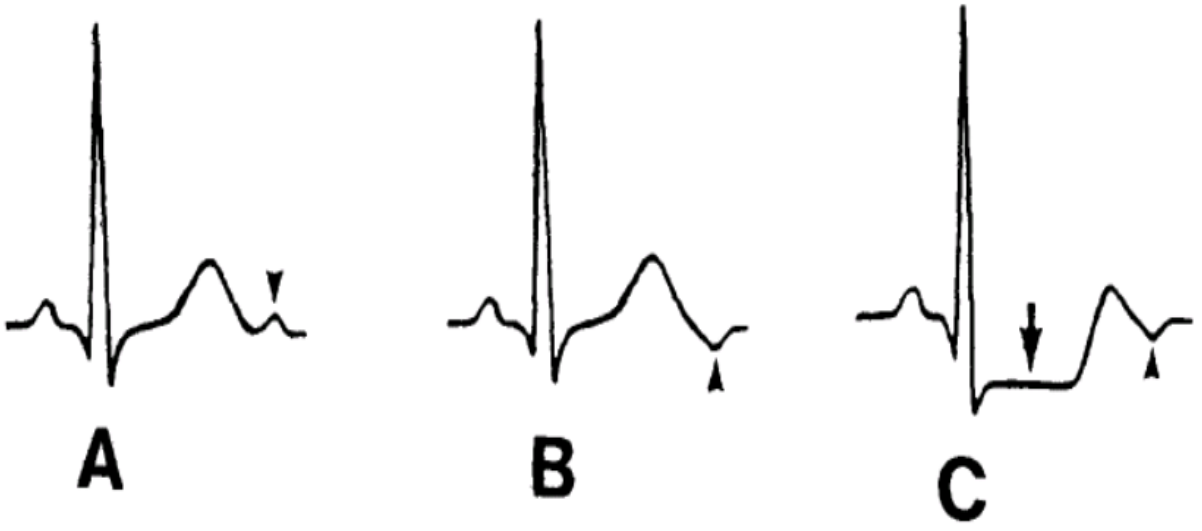


Fig. 2.31 Diagram showing: (A) Normal upright U wave (arrowhead). (B) Isolated U wave inversion (arrowhead). (C) U wave inversion (arrowhead) associated with ST segment depression (arrow).

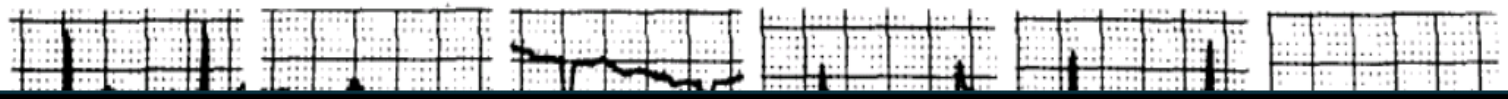


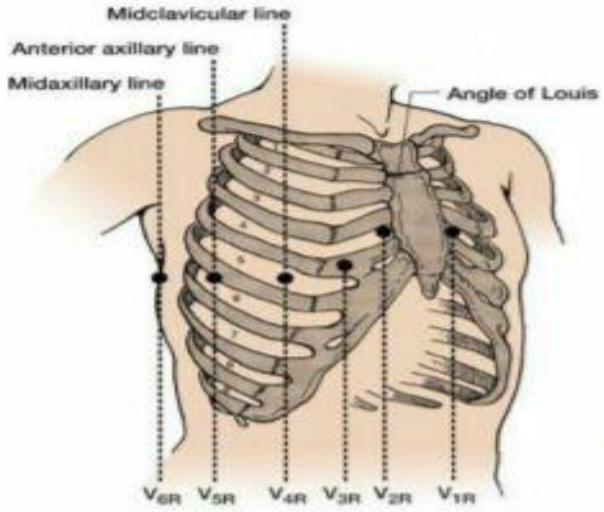
Right-Sided ECG

Recommended Clinical Practice

To detect right ventricular STEMI associated with occlusion of the right coronary artery, obtain a right-sided ECG. [1-3] **[Level A Recommendation]**

When a 15-lead &/or 18-lead ECG machine is not available, manipulation of the leads from a standard 12-lead ECG machine allow additional areas of the heart to be imaged.[4-5]

- Indications of a RV wall infarction may include:[4-7]
  - ST elevation in the inferior leads, II, III, and aVF[4-6]
    - ST elevation that is greatest in lead III is especially significant[5,8-9]
  - ST elevation in V_1 (considered to be the only precordial lead that faces the RV on the standard 12-lead ECG)[4-6,8]
  - Other findings may include: right bundle branch block, second- and third- degree atrioventricular blocks, ST segment elevation in lead V_2 50% greater than the magnitude of ST segment depression in lead aVF[5,8]
  - Hypotension and clear lung fields[6,10]
- Place ECG electrodes (stickers) as follows[4] (Figure 1):



Right-sided ECG Electrode Placement

V_1R: 4th intercostal space, left sternal border

V_2R: 4th intercostal space, right sternal border

V_3R: halfway between V2R and V4R, on a diagonal line

V_4R: 5th intercostal space, right midclavicular line

V_5R: right anterior axillary line, same horizontal line as V4R and V6R

V_6R: right mid-axillary line, same horizontal line as V5R and V6R

Arm and leg electrodes remain unchanged from standard 12-lead ECG

Figure 1 used with permission from Barbara J. Drew, RN, PhD, FAAN, FAHA [Drew, B. J., & Ide, B. (1995). Right ventricular infarction. *Progress in Cardiovascular Nursing, 10*, 46.]

- Place ECG lead cables as follows (using a 12-lead machine):
  - A right-sided ECG is a "mirror reflection" of the standard left sided 12-lead ECG. Begin with lead cable V_1 and attach it to electrode V_1R, continue connecting lead cables to electrodes in sequence until lead cable V_6 is connected to electrode V_6R
  - Arm and leg electrodes and lead cables remain unchanged from the standard 12-lead ECG placement

Sgarbossa Criteria

Digoxin toxicity

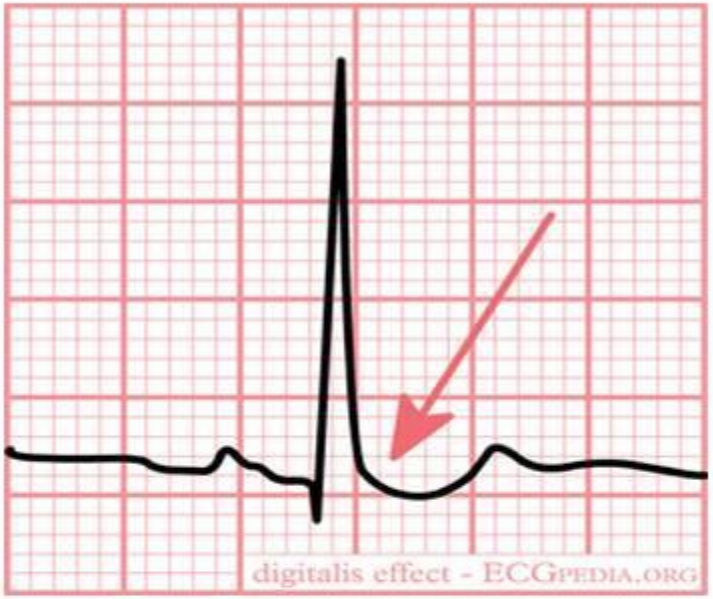
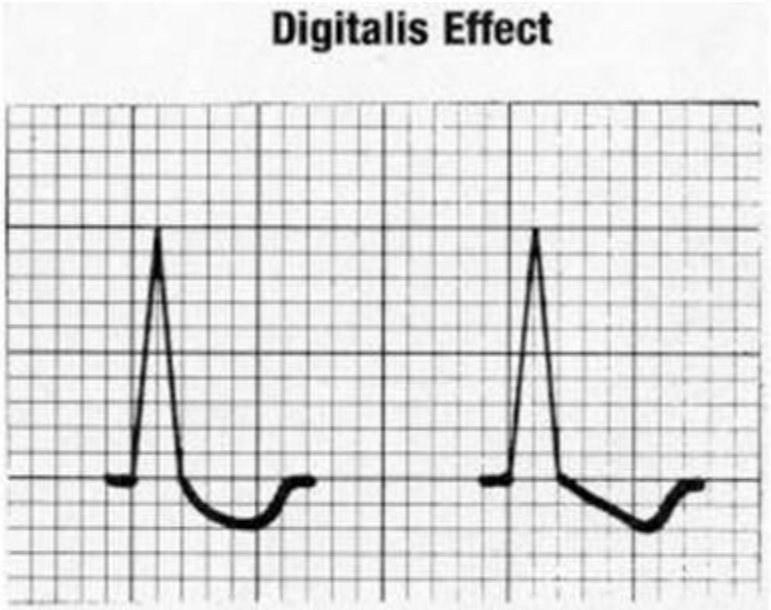
Symptoms in Acute and Chronic Digoxin Overdose

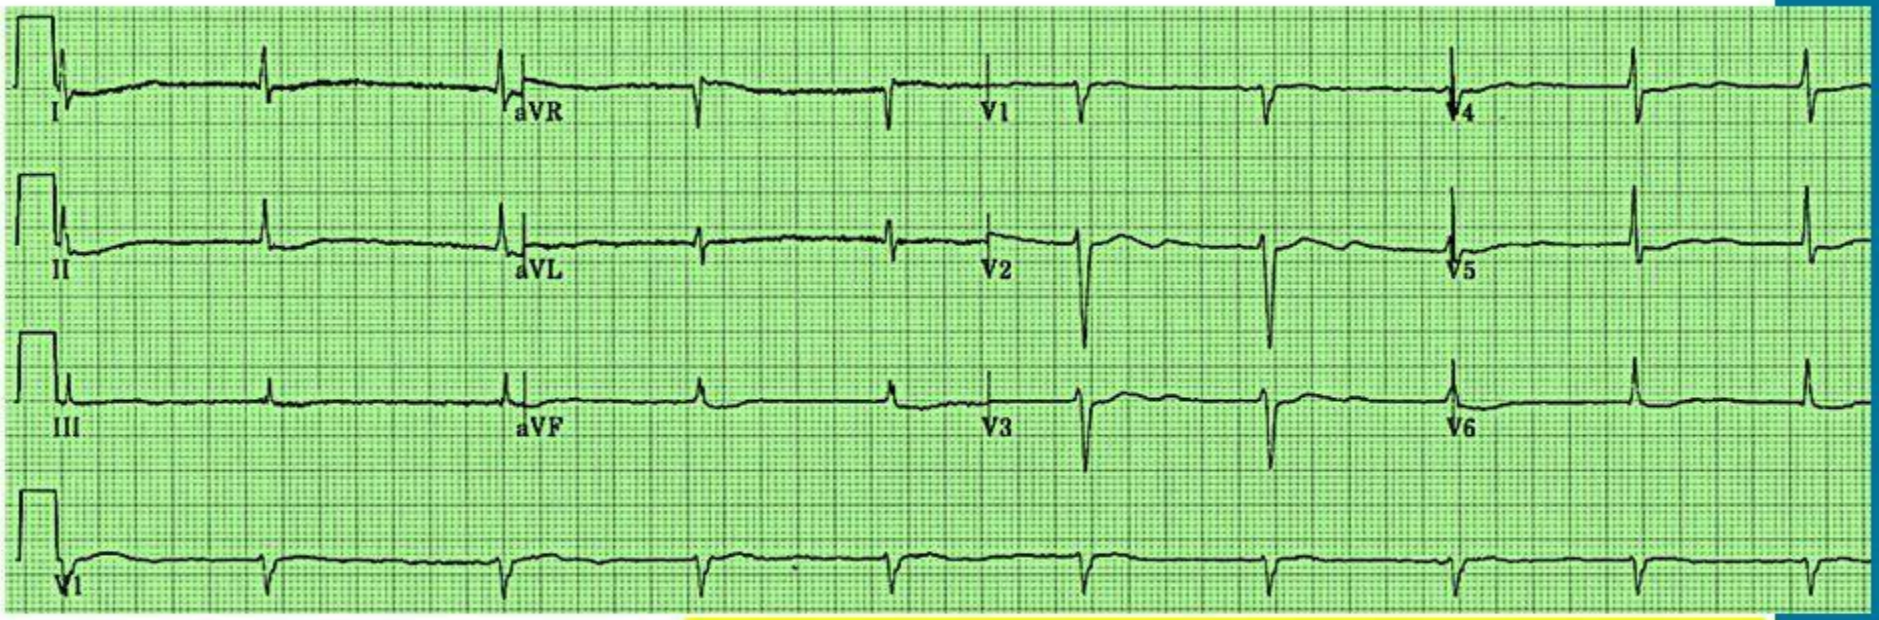
Acute Toxicity	Chronic Toxicity
■ GI: Nausea, vomiting, and abdominal pain • Absence of nausea and vomiting hours after exposure make acute digoxin toxicity unlikely ■ CV: Dysrhythmias • Hypotension secondary to dysrhythmia ■ CNS: Lethargy, confusion, weakness	■ Symptoms tend to be more insidious ■ GI symptoms less pronounced ■ Neuro symptoms more pronounced • Delirium, confusion, drowsiness, hallucinations ■ CV: dysrhythmias • Hypotension secondary to dysrhythmia ■ Visual changes such as alterations in color vision • Scotomas or blindness

Digoxin toxicity





Digitalis Effect



Digoxin Effect with Evidence of Toxicity

- ECG Findings
- ● ST segment shortening and depression leading to a“scooped” appearance
- ● QT interval shortening
- ● PR interval prolongation
- ● Decreased T wave amplitude
- ● Premature ventricular complexes are the most commondysrhythmia
- ● Bradydysrhythmias, various heart blocks, especially with findings consistent with increased automaticity (atrialtachycardia with block, atrial fibrillation with slow ventricular response, accelerated junctional rhythms)
- ● Bidirectional ventricular tachycardia may rarely be seen

PH08

Clinical Significance

- Wellens' syndrome is a pattern of **deeply inverted or biphasic T waves in V2-3**, which is highly specific for a **critical stenosis of the left anterior descending artery** (LAD).
- Patients may be pain free by the time the ECG is taken and have normally or minimally elevated cardiac enzymes; however, they are at extremely **high risk for extensive anterior wall MI** within the next few days to weeks.
- Due to the critical LAD stenosis, these patients usually require invasive therapy, do poorly with medical management and may suffer MI or cardiac arrest if inappropriately stress tested.

معیارهای تشخیص RVMI در ECGسمت چپ به روایت شمروث

1- S>1mm در لید V1

2- در لید V2 اگر ST depression مساوی یا کمتر از 50 درصد ST elevation لید avf باشد

3- ST elevation در لیدهای V1 تا V6 ولی با این معیار که میزان الویشن از V1به سمت V6کاهش میابد یعنی الویشن در V1از همه بلند تر و در V6از همه کوتاهتر است و Qهم وجود ندارد

(در Ant MIمیزان الویشن از V1تا V6افزایش می یابد و Qپاتولوژیک داریم)

4-در V1، ST elevation و در V2، ST depression داشته باشیم

How to spot right ventricular infarction

The first step to spotting RV infarction is to suspect it… in all patients with inferior STEMI!

In patients presenting with inferior STEMI, right ventricular infarction is suggested by the presence of:

- **ST elevation in V1** - the only standard ECG lead that looks directly at the right ventricle.
- **ST elevation in lead III > lead II** - because lead III is more "rightward facing" than lead II and hence more sensitive to the injury current produced by the right ventricle.

Other useful tips for spotting right ventricular MI

If the magnitude of ST elevation in V1 exceeds the magnitude of ST elevation in V2.

- If the ST segment in V1 is isoelectric and the ST segment in V2 is markedly depressed.
- ***NB. The combination of ST elevation in V1 and ST depression in V2 is highly specific for right ventricular MI.***

Right ventricular infarction is confirmed by the presence of ST elevation in the right-sided leads (V3R-V6R). Right-sided leads

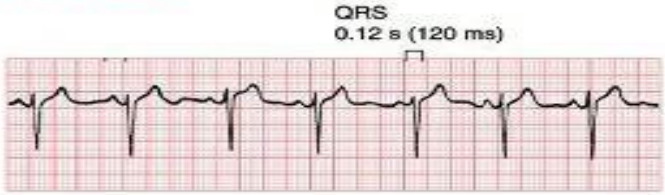
De Winter ST/T-Waves

منظور از تاکی‌کاردی از نوع Narrow QRS چیست؟

- Narrow QRS Complex Tachycardia به این معناست که QRS Duration در آن کمتر از 3 خانهٔ کوچک (کمتر از 0.12 ثانیه یا 120 msec) می‌باشد.
- لازم به ذکر است که در ECG هر خانهٔ کوچک معادل 0.04 sec یا 40 msec می‌باشد.

Normal QRS Complex



پس QRS Duration در AVNRT، کمتر یا مساوی 3 خانهٔ کوچک در EKG است.

Rhythm و Rate در AVNRT چگونه است؟

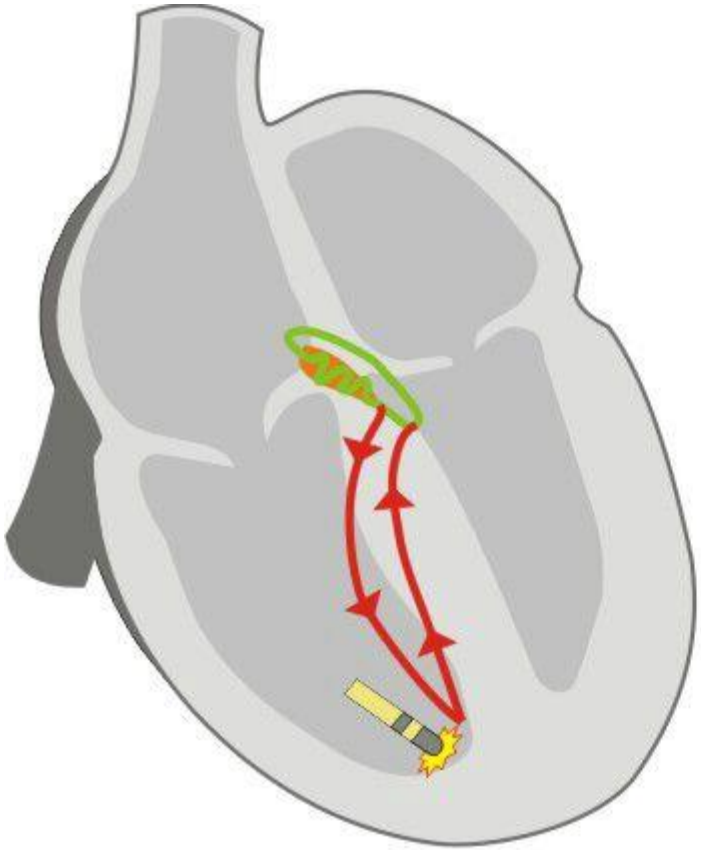
- ریتم در PSVT منظّم است.

Braunwald's: معمولاً QRS Rate بین **150** beats/min تا **250** است.

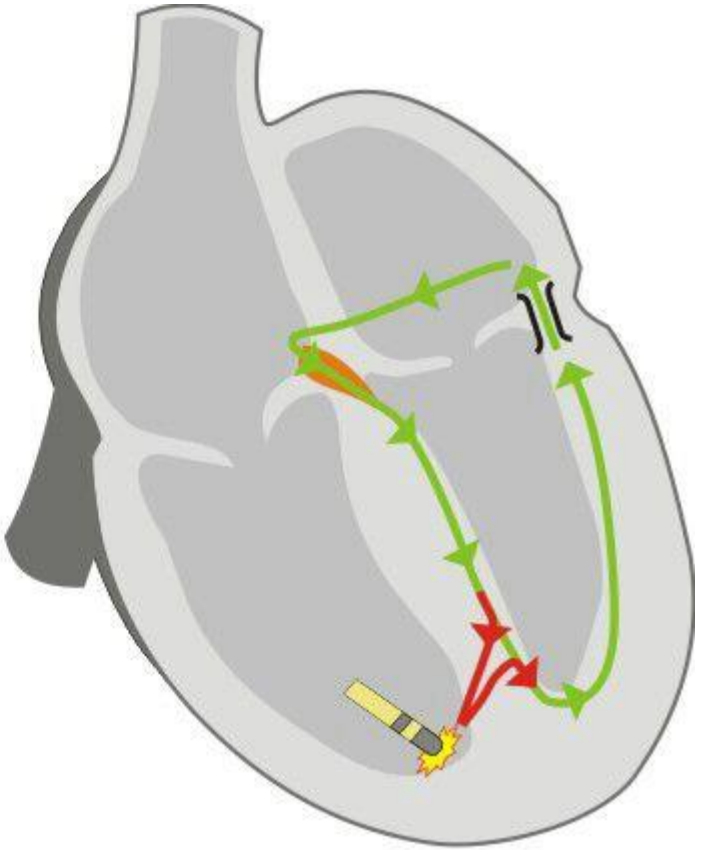
- البته در رفرانس‌های گوناگون و البتّه معتبر، بازه‌های مختلفی بیان شده است.
- در بعضی رفرانس‌ها بین 120 تا 250 – 200 هم ذکر شده است.
- به طور ناشایع Rate ممکنست به کمتر از 110 هم برسد.
- گاهی، بویژه در اطفال ممکنست Rate به بالاتر از 250 هم برسد.
- سرعت تا 300 هم ممکنست برسد و تفسیر را با مشکل مواجه کند.

Types of SVT

- PSVT (PAT, AVNRT ,AVRT)
- Accessory pathway tachycardia (WPW)
- Atrial tachycardia
- Atrial fibrillation
- Atrial flutter
- Junction Tachycardiardia
- Sinus Tachycardiardia



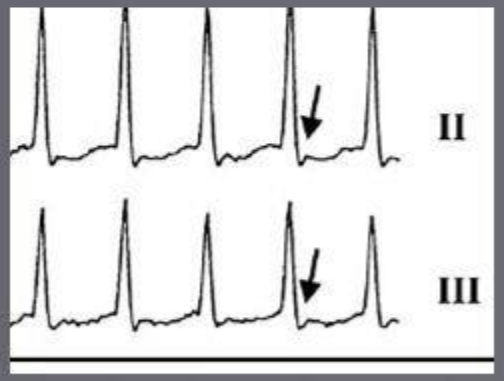
AVNRT



AVRT

AVNRT vs. AVRT: Can you tell them apart

- Helpful ECG findings
  - Pseudo R' in V1
  - Pseudo S in II, III, aVF
    - specific (but not sensitive) for AVNRT
  - ST elevation in aVR
  - RP >100 ms
  - ST depression ≥2mm
    - Suggest (not highly specific or sensitive) AVRT



Bottom line = 12-lead lacks 100% accuracy but important to look because AVRT more serious Dx

See Adam Osters talk July 22, 2004 for more detailed explanation

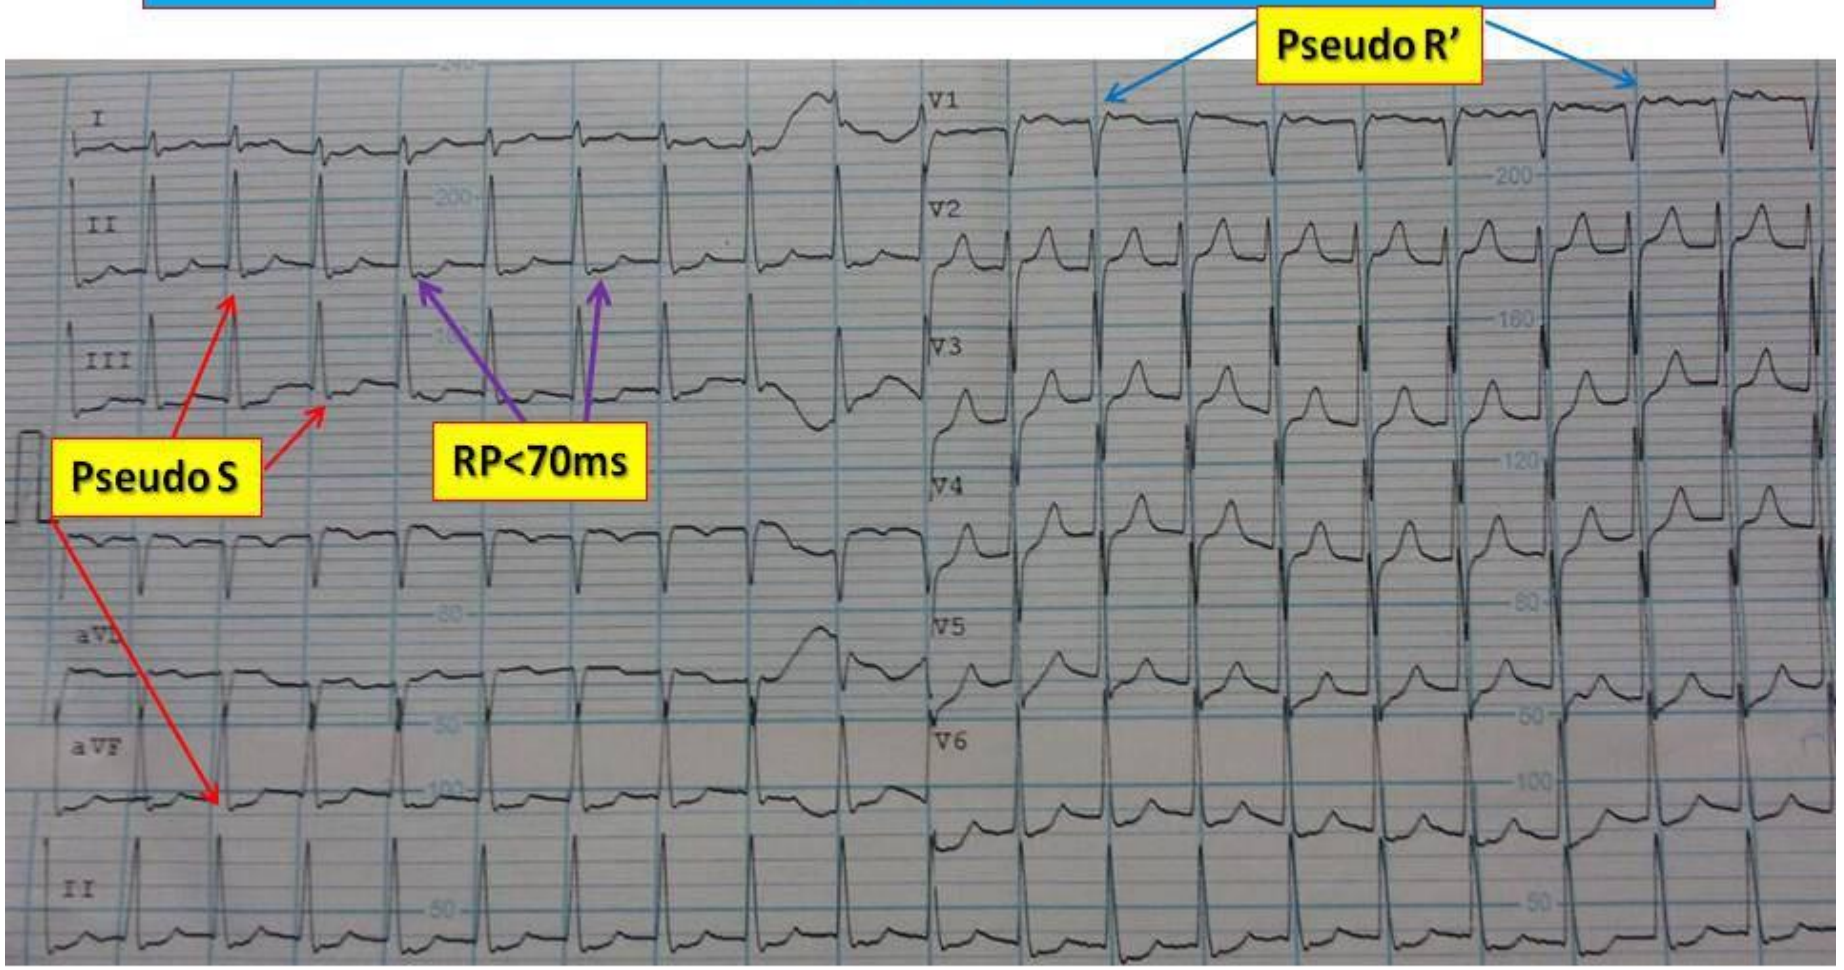
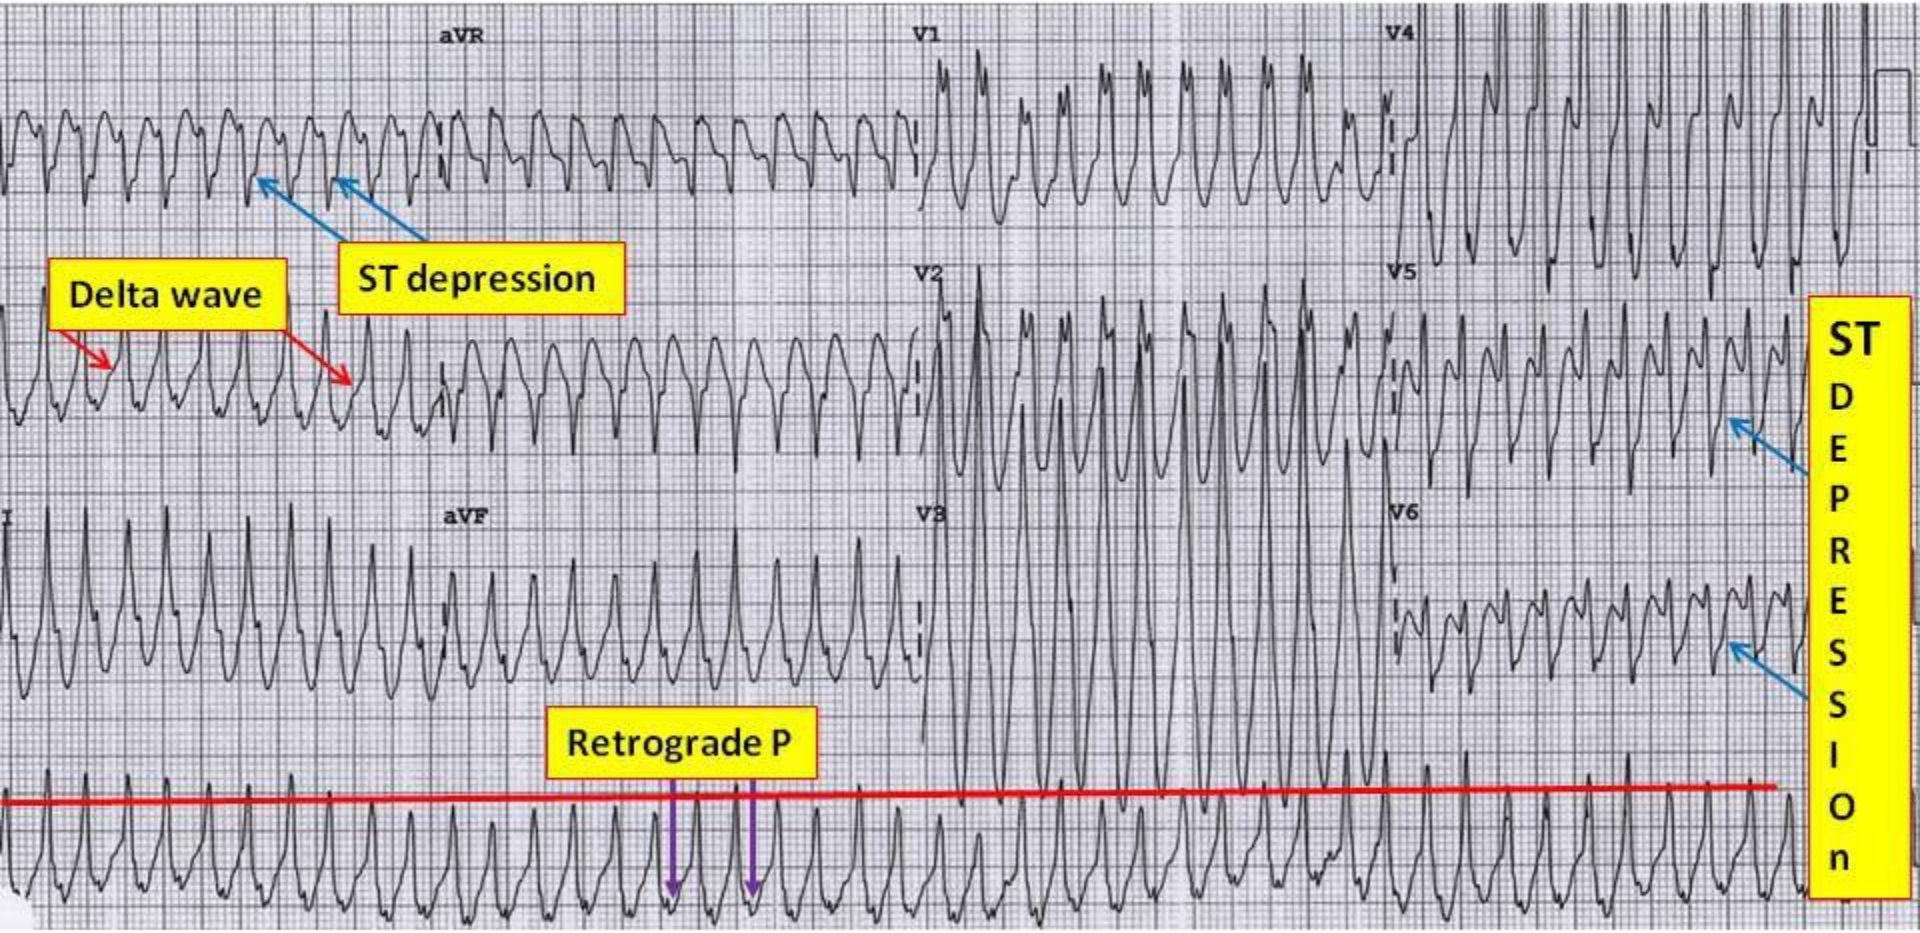
Atrioventricular nodal re-entry tachycardia
AVNRT



Atrioventricular re-entry tachycardia
AVRT



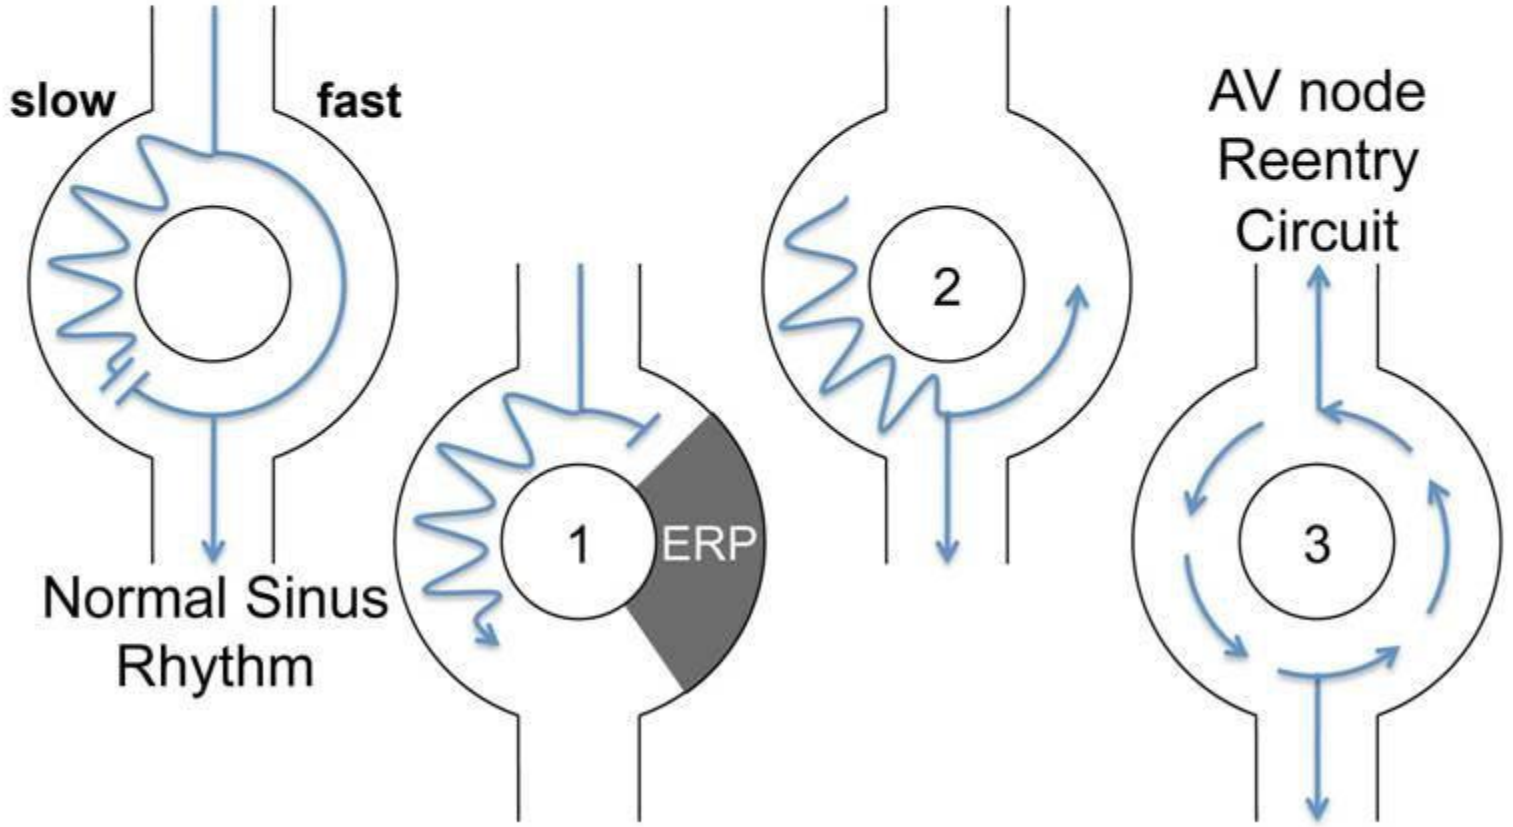
ECG Findings AVNRT

- Regular tachycardia ~140-280 bpm.
- QRS complexes usually narrow (< 120 ms)
- ST-segment depression may be seen with or without CAD.
- QRS alternans.
- P waves if visible retrograde in II, III, AVF.
- P waves may be visible after the QRS complex, or very rarely visible before the QRS complex.
- Pseudo R' wave may be seen in V1 or V2.
- Pseudo S waves may be seen in leads II, III , AVF.

Mechanism of AVNRT

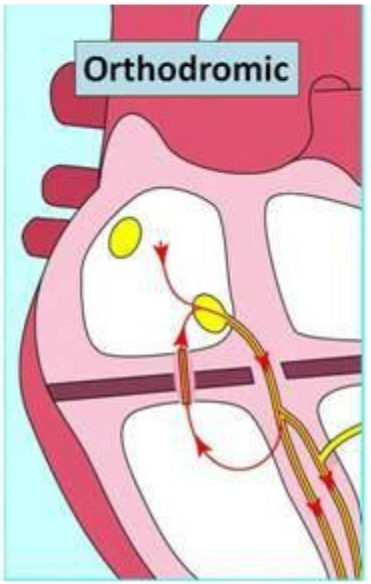
The **slow pathway** (*alpha*)

The **fast pathway** (*beta*)



ECG finding of AVRT (orthodromic)

- Rate usually 200 – 300 bpm
- P waves may be hidden in QRS complex or retrograde
- QRS Complex usually <120 ms unless existing bundle branch block
- QRS Alternans
- T wave inversion common
- ST segment depression



Treatment of orthodromic AVRT

- Treatment of AVRT is based on the presence of hemodynamic instability e.g. hypotension, altered mental state, or pulmonary edema.
- In hemodynamic stable
  - vagal maneuvers
  - adenosine
  - calcium-channel blockers
  - DC Cardioversion if non-responsive to medical therapy.
- In hemodynamic unstable , urgent synchronized DC Cardioversion.

AVNRT ECG Recognition

- Regular or irregular because of varying conduction through the AV node.
- Rate: 170-250 bpm
- Conduction ratio: usually 1:1, uncommonly 2:1
- Typical:
  - The retrograde P wave is seen within, or in close proximity to the terminal portion of the QRS complex (Short RP)
  - Pseudo s wave
  - Presence of a notch in lead aVL is a sensitive and specific predictor of a diagnosis of AVNRT*
- Atypical:
  - The retrograde P wave occurs late, within or following the T wave (Long RP).

*Utility of the aVL lead in the electrocardiographic diagnosis of atrioventricular node reentrant tachycardia. Darío Di Toro, et al. Europace (2009) 11, 944–948

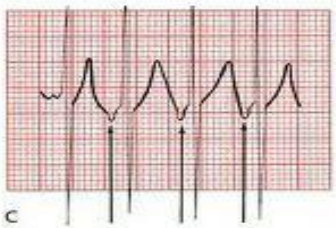
✓ در این Box، خلاصه‌ای از یافته‌های ECG در Typical AVNRT را با هم مرور می‌کنیم.

ECG Findings:

1. ابتدا با دیدن یک تاکی‌کاردی کاملاً منظم – با Narrow QRS (کمتر از 3 خانه کوچک) – که سرعتی معمولاً بین 150 تا 250 b/min دارد؛ به AVNRT مشکوک می‌شویم.
2. **حال به دنبال موج P می‌گردیم تا ببینیم موج P در ECG قابل تشخیص هست یا نه؛ که در اکثریت موارد هم موج P در ECG مشاهده نمی‌کنیم.**
3. امّا اگر موج P قابل رؤیت باشد؛ (در 30 درصد موارد)، به دو صورت می‌توانیم آن را ببینیم:
   a. **در حالت شایع‌تر** یک دندانه یا بریدگی (Notching) کوچک در قسمت انتهایی QRS در لید V_1 می‌بینیم (Pseudo r' wave) که سبب بوجود آمدن الگوی **RSR'** در لید V_1 و یا **Pseudo S wave** در لیدهای تحتانی **II – III – aVF** می‌شود.
   b. **به صورت غیر شایع** ممکنست موج P بلافاصله قبل یا بلافاصله بعد از QRS دیده شود.
4. به طور شایعی ممکنست بویژه در Rate بالا، **ST Depression** ببینیم؛ که لزوماً نشاندهندهٔ ایسکمی میوکارد نیست. (نویسنده: بویژه در فرد جوان بدون مشکل زمینه‌ای)
5. باز هم به طور شایعی ممکنست بعد از خاتمهٔ AVNRT، در نوار قلب **Inverted T wave** در لیدهای **Anterior** و **Inferior** ببینیم که باز هم نشاندهندهٔ CAD نیست.



امّا اگر مانند ECG بیمار اوّل، ST Depression مشاهده کردید، به اشتباه نیفتید...

- در AVNRT با سرعت بالا، بطور شایع ممکنست ST Depression دیده شود، حتّی بدون وجود CAD و وجود آن لزوماً نشاندهندهٔ ایسکمی میوکارد نیست. (نویسنده: بویژه در فرد جوان و بدون مشکل (مینه‌ای)
- در 25% تا 50% بیماران، Significant ST Depression در حین تاکی‌کاردی در AVNRT دیده می‌شود که لزوماً پیشگو کنندهٔ ایسکمی نیست.

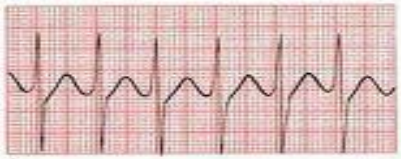
ممکنست بعد از خاتمهٔ اپیزود حمله T wave Inversion هم مشاهده شود...

- در حدود 40 % بیماران بعد از خاتمهٔ اپیزود حمله Newly T wave Inversion معمولاً در لیدهای Anterior و Inferior دیده می‌شود. (T wave Inversion After Termination)
- این T inversion ممکنست بلافاصله بعد از خاتمهٔ تاکی‌کاردی دیده شود، یا تا 6 ساعت بعد از خاتمهٔ آن ظهور پیدا کند و تا مدّت زمان متغیری باقی بماند. (به طور متوسط 34 ساعت)
- این یافته به Rate و یا Duration تاکی‌کاردی بستگی ندارد.
- گرچه این T Inversion به خاطر رپولاریزاسیون غیرنرمال ظاهر می‌شود، ولی بعلّت بیماری عروق کرونری نیست، بلکه ممکنست بعلّت تغییرات غلظت یونی در نتیجهٔ Rate بالا باشد.

معمولاً P دیده نمی‌شود؛ چونکه توسط QRS پوشیده شده است. (شکل A)

بسیاری اوقات موج P توسط QRS پوشیده شده و به هیچ عنوان در ECG دیده نمی‌شود.

- اگر هم موج P دیده شود، معمولاً بصورت inverted P در لیدهای تمتانی aVF III II مشاهده می‌شود. (چونکه دهلیزها دارند به طور غیرطبیعی و از سمت گره AV بصورت رتروگرید دپولاریزه می‌شوند).



NO P wave

A

امـــــــا بهترین شانس شما برای دیدن موج P چیست؟

- بهترین شانس، دیدن Pseudo R' wave در لید V_1 است.
- به این معنا که ممکنست که یک دندانه یا بریدگی (Notching) کوچک در قسمت انتهایی QRS ببینیم که نشاندهندهٔ Superimposed شدن P روی QRS است. (Pseudo R' wave)
- این حالت سبب بوجود آمدن Small R wave در قسمت انتهایی کمپلکس QRS و تولید Pseudo R' wave و الگویی به نام RSR' در لید V_1 و همچنین Pseudo S wave در لیدهای تمتانی (II – III – aVF) می‌شود. (شکل B)

وجود الگوی **RSR'** در لید V_1 یا وجود **Pseudo S wave** در لیدهای **II – III – aVF** به نفع Typical AVNRT می‌باشد.

البتّه RSR' Pattern گاهی فقط با مقایسه با ریتم سینوسی قبلی بیمار قابل تشخیص است.

- بطور ناشایع‌تری، ممکنست موج P معکوس، بلافاصله قبل یا بلافاصله بعد از QRS دیده شود. (شکل C)

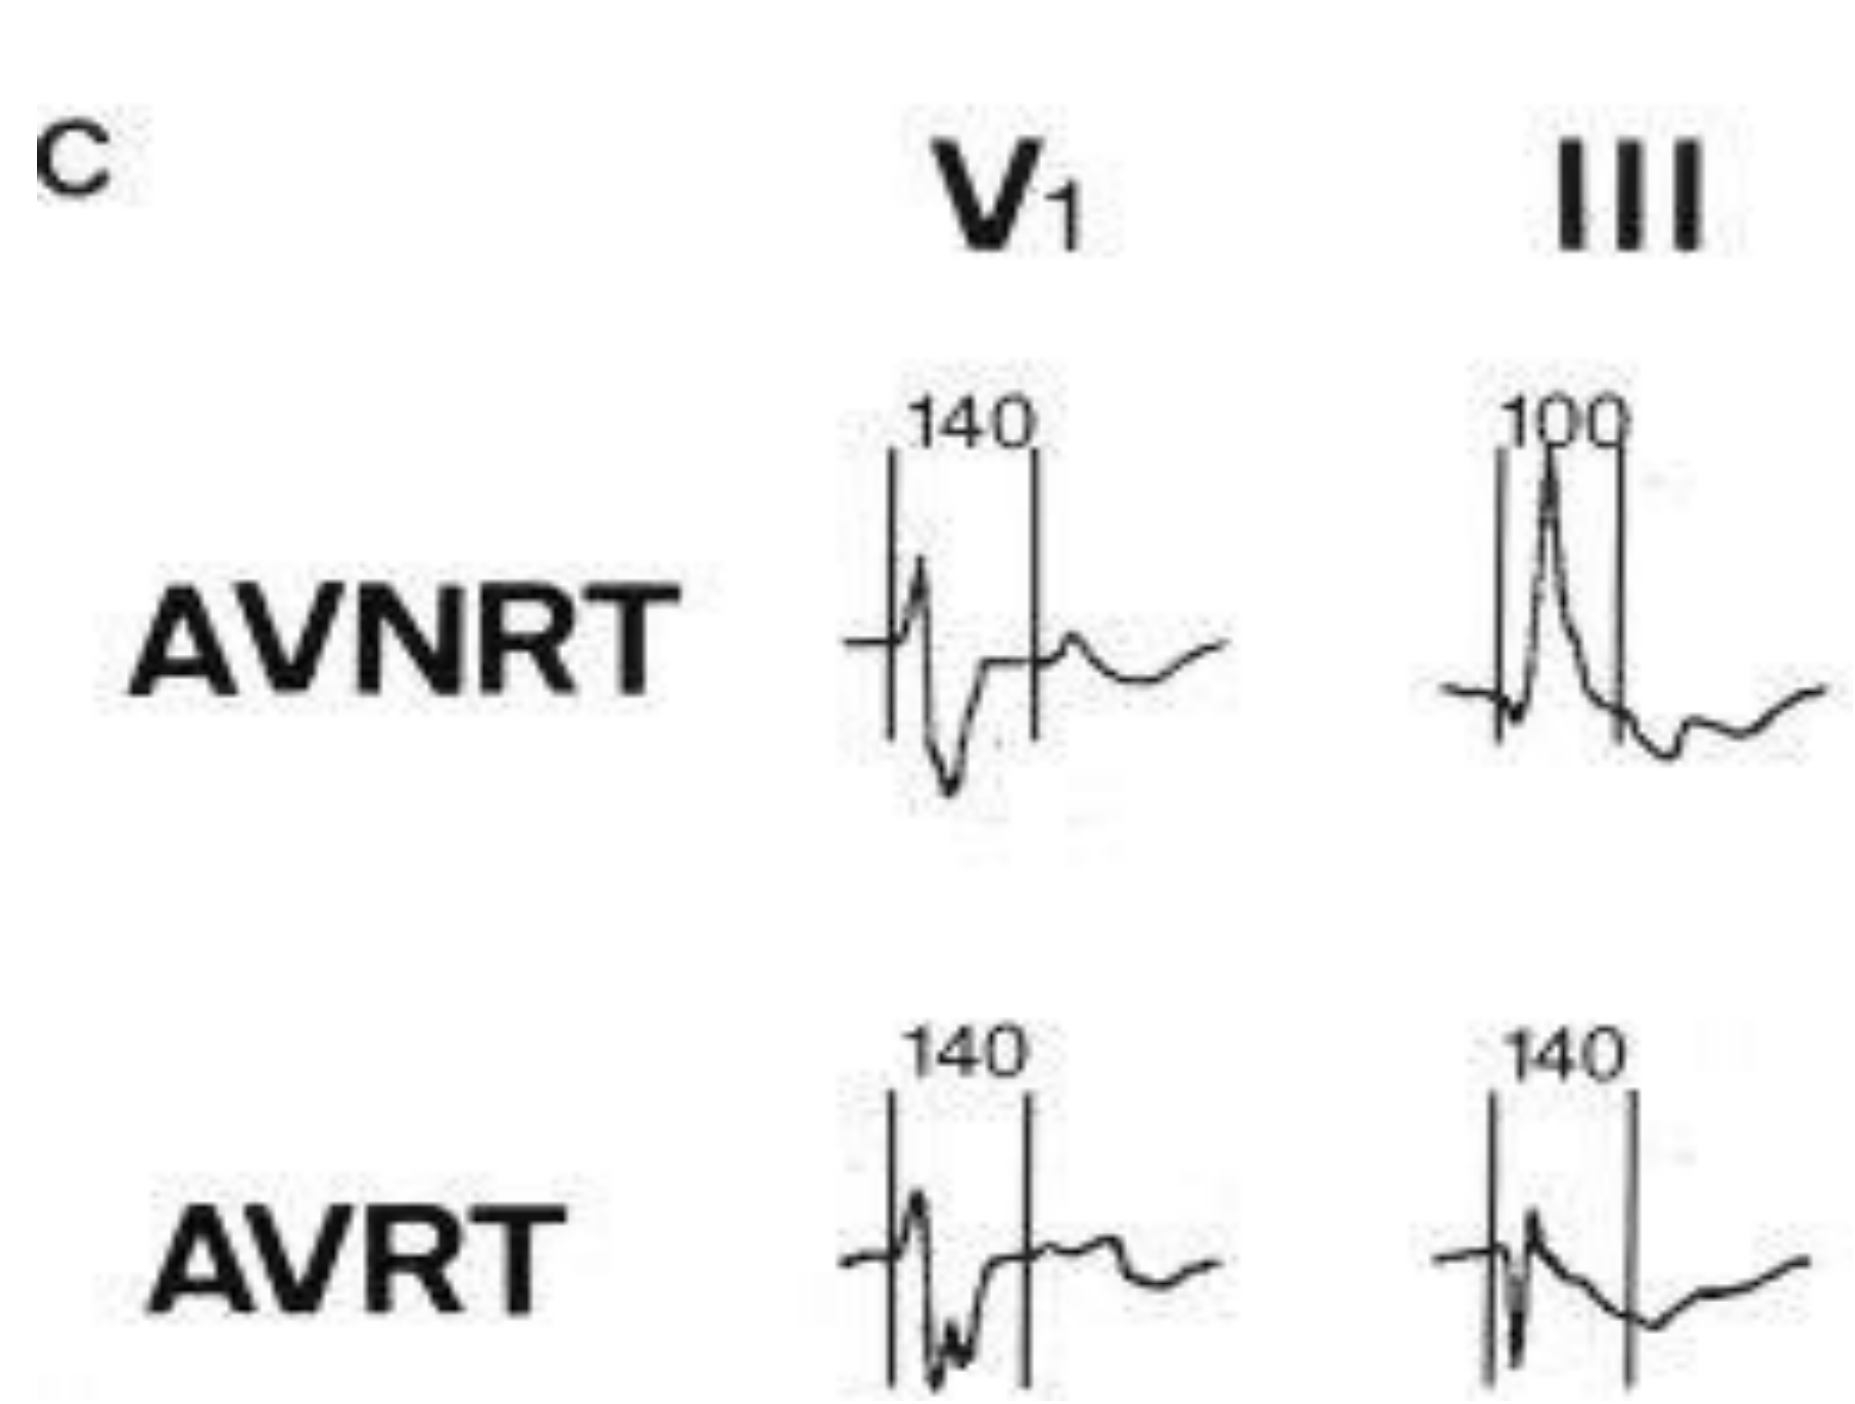
AVNRT ECG Recognition

- Regular or irregular because of varying conduction through the AV node.
- Rate: 170-250 bpm
- Conduction ratio: usually 1:1, uncommonly 2:1
- Typical:
  - The retrograde P wave is seen within, or in close proximity to the terminal portion of the QRS complex (Short RP)
  - Pseudo s wave
  - Presence of a notch in lead aVL is a sensitive and specific predictor of a diagnosis of AVNRT*
- Atypical:
  - The retrograde P wave occurs late, within or following the T wave (Long RP).

*Utility of the aVL lead in the electrocardiographic diagnosis of atrioventricular node reentrant tachycardia. Darío Di Toro, et al. Europace (2009) 11, 944–948

Heart Rate: 76bpm

C



Causes of long QT_C interval

Congenital (at least six genetic mutations identified)

- Romano-Ward syndrome (autosomal dominant)
- Jervell and Lange-Nielsen syndrome (cardiac abnormality - autosomal dominant & associated deafness - autosomal recessive)

Acquired

- drugs
- cardiac pathology (heart failure, ischaemia, myocarditis)
- electrolyte abnormality (hypokalaemia, hypomagnesaemia)
- cerebrovascular disease (subarachnoid haemmorhage, ischaemic stroke)
- severe bradycardia (especially complete heart block)
- hyperthyroidism/hypothyroidism

SQTS even if asymptomatic. Exclude II° causes
QTc (msec)
QTc (msec)

Long-QT Syndrome

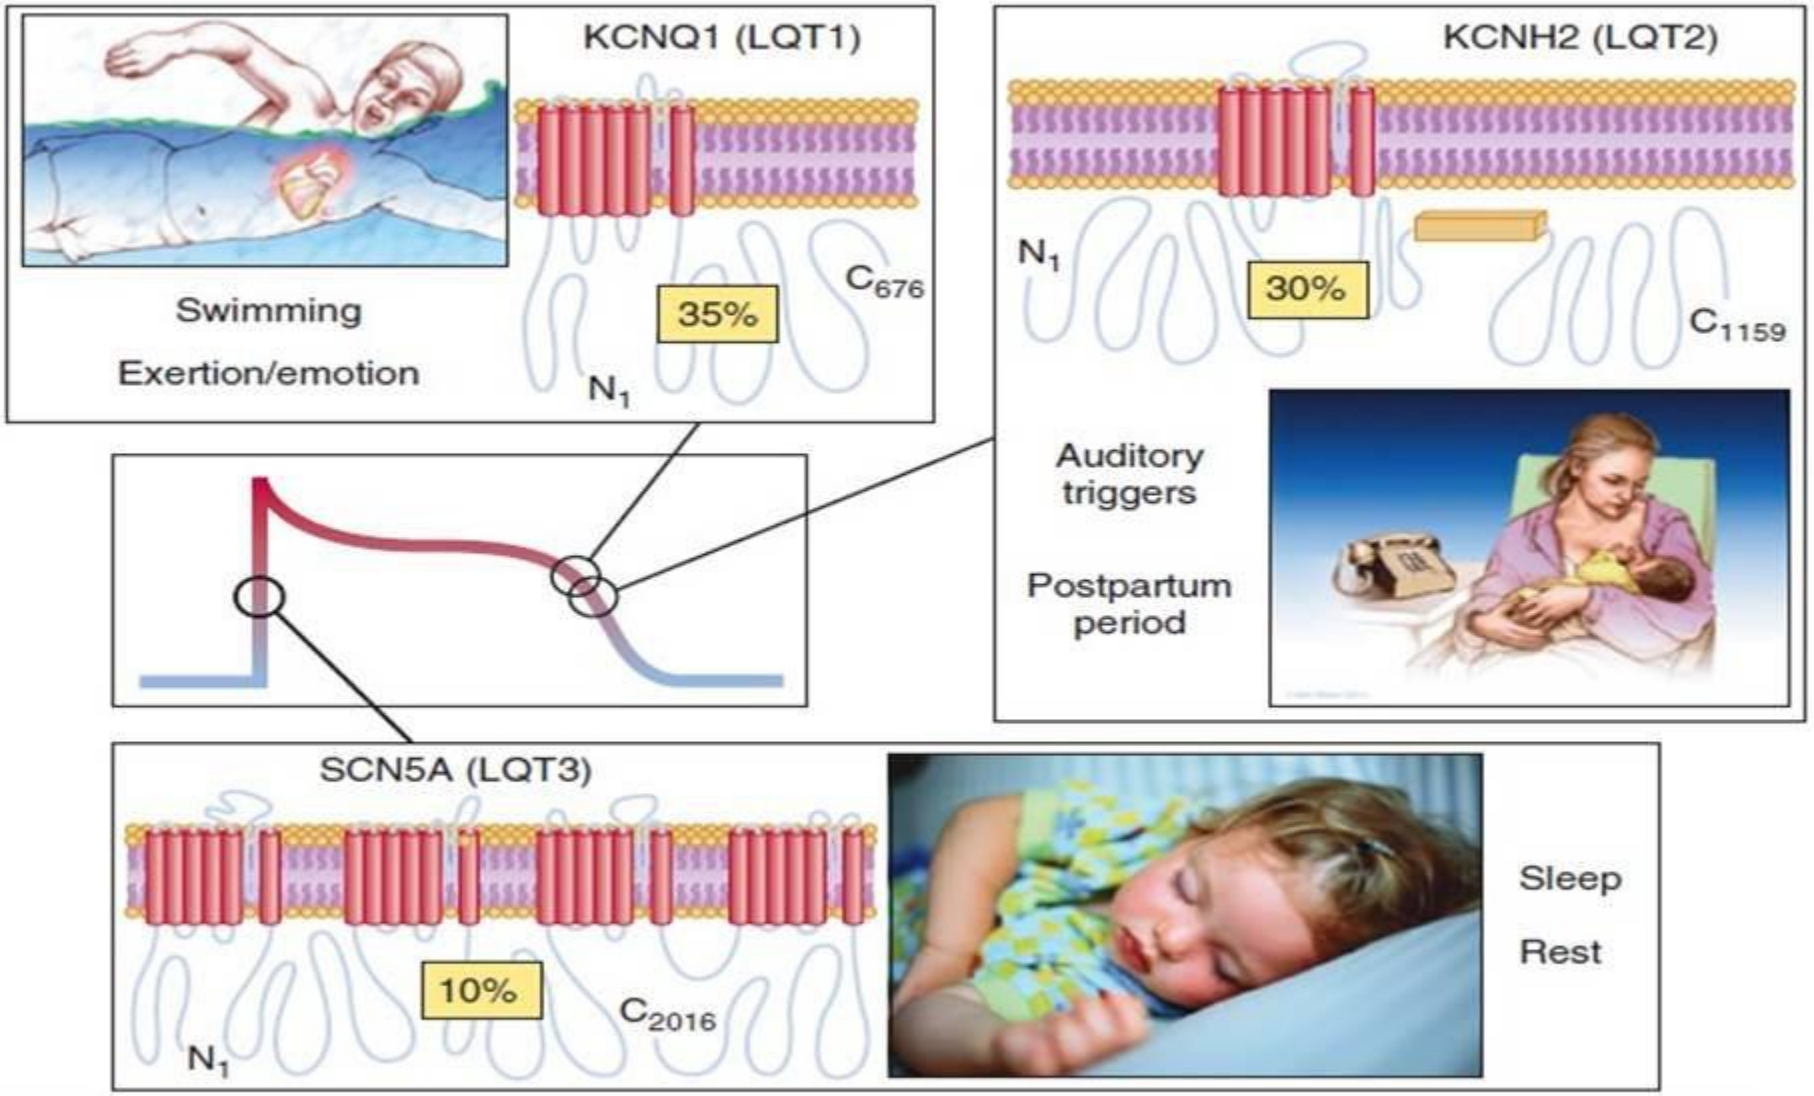

FIGURE 32-3 Genotype-phenotype correlations in LQTS. Seventy-five percent of cases of clinically strong LQTS are due to mutations in three genes (*KCNQ1*, 35%; *KCNH2*, 30%; and *SCN5A*, 10%) encoding for ion channels that are critically responsible for orchestration of the cardiac action potential. Genotype-phenotype correlations have been observed, including swimming/exertion/emotion and LQT1, auditory triggers/postpartum period and LQT2, and sleep/rest and LQT3.

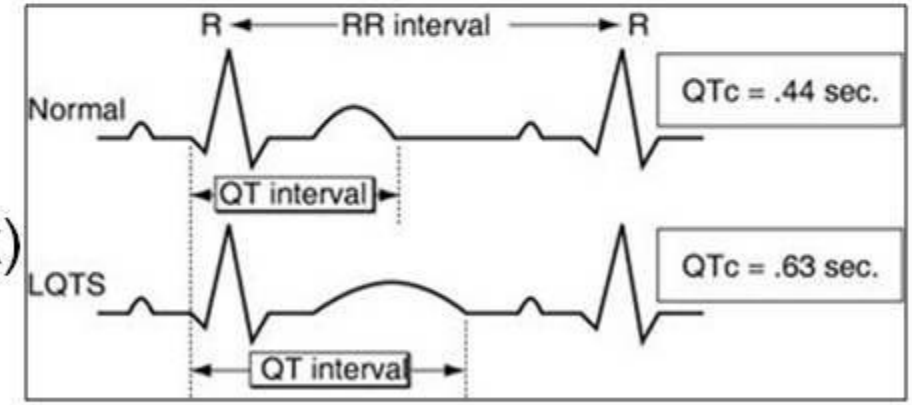
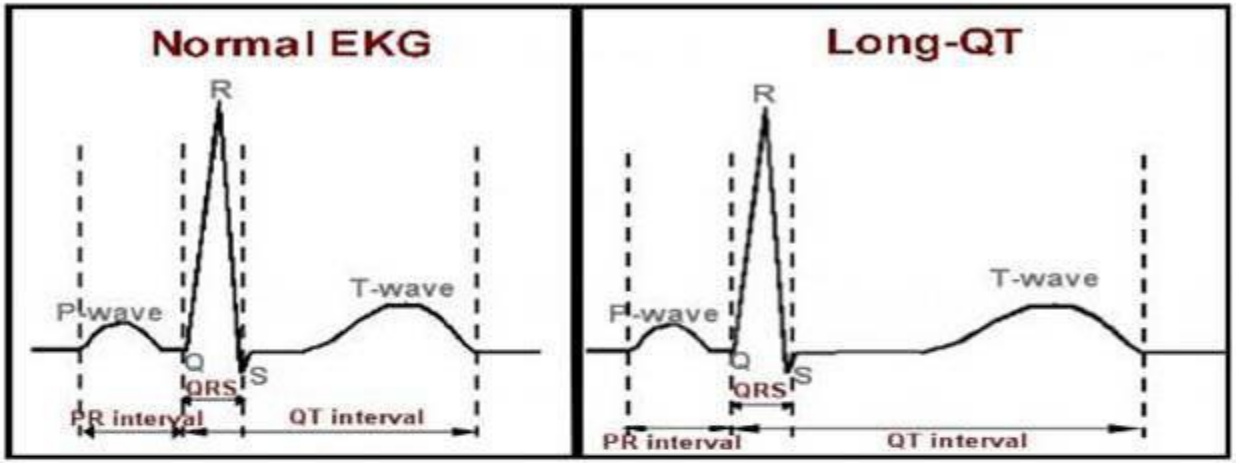
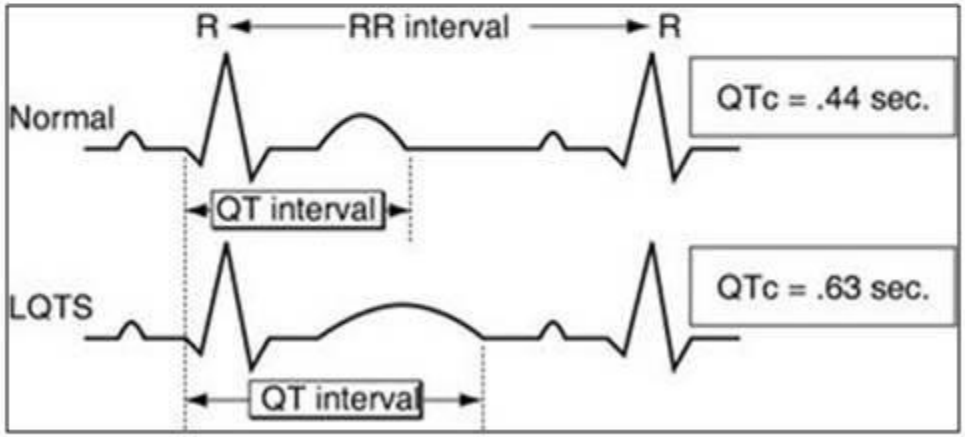
Long-QT Syndrome

- QT prolongation (450- 470 msec)
- increased risk for syncope, seizures, and SCD in the setting of a structurally normal heart and otherwise healthy individual.
- The incidence of LQTS may exceed 1 in 2500 Persons
- This repolarization abnormality is triggers such as:
  - exertion
  - swimming
  - emotion
  - Auditory stimuli (alarm clock)
  - postpartum period

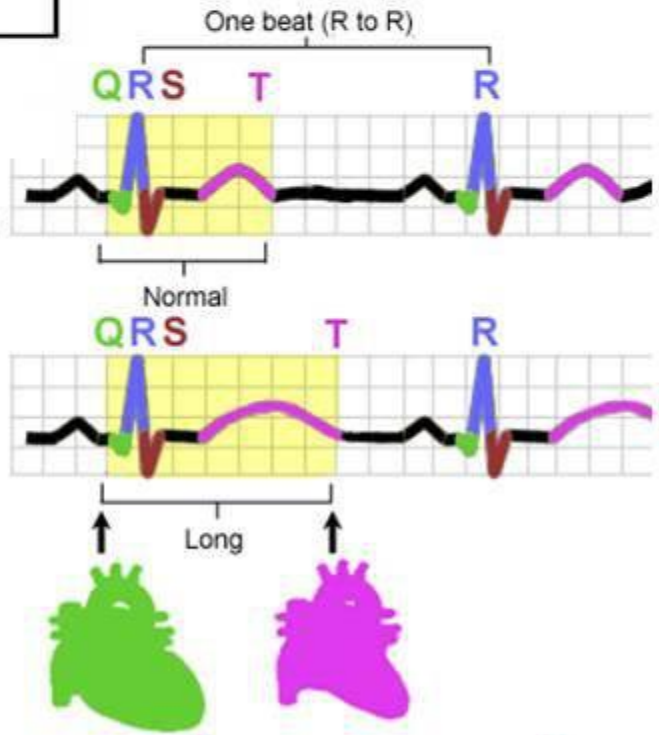


Long-QT Syndrome





Each section of an electrocardiogram (ECG or EKG) is referred to by a letter name: Q, R, S, and T.

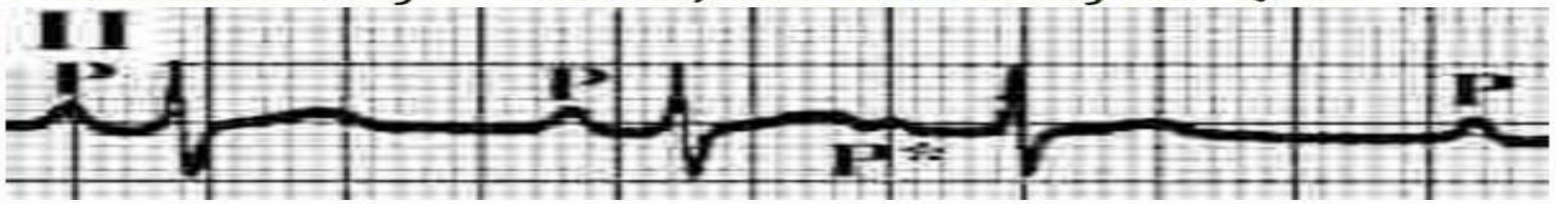


ECG II Rhythms and Traces

Premature Atrial Contraction (PAC)

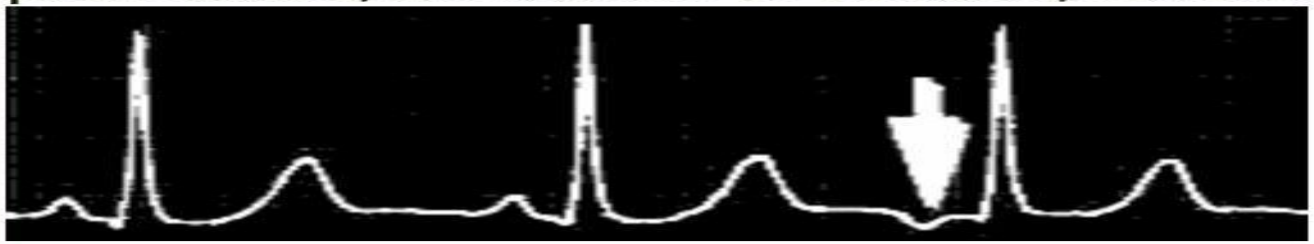
Atrial Premature Depolarization (APD)

Preceded by P wave, followed by nl QRS



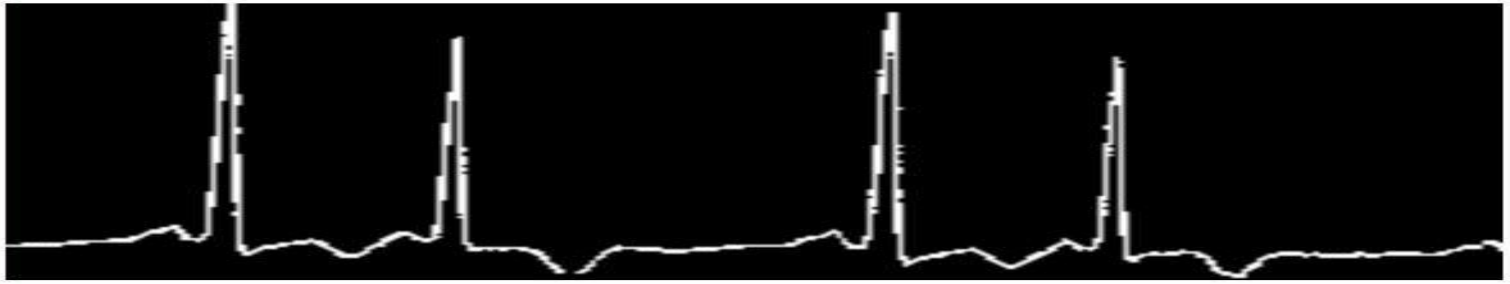
Premature Atrial Contraction

Aberrantly conducted PAC. Bizarre QRC. P wave is premature, abnormal or hidden, followed by nl QRC

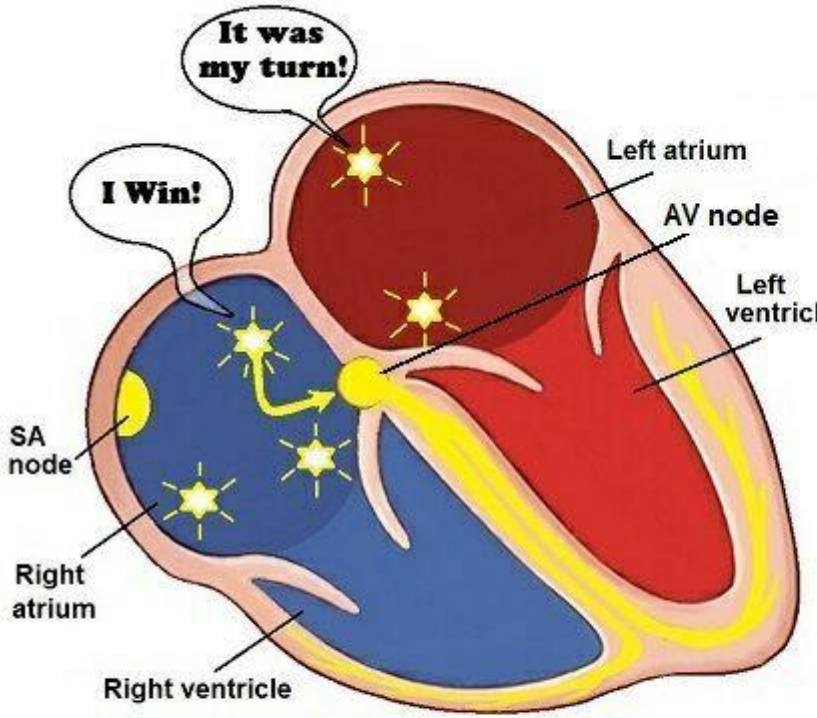


Atrial Bigeminy

(every other beat is a PAC) P wave is premature, abnormal or hidden, irregular rhythm. PR interval <.20s / QRS <.12s

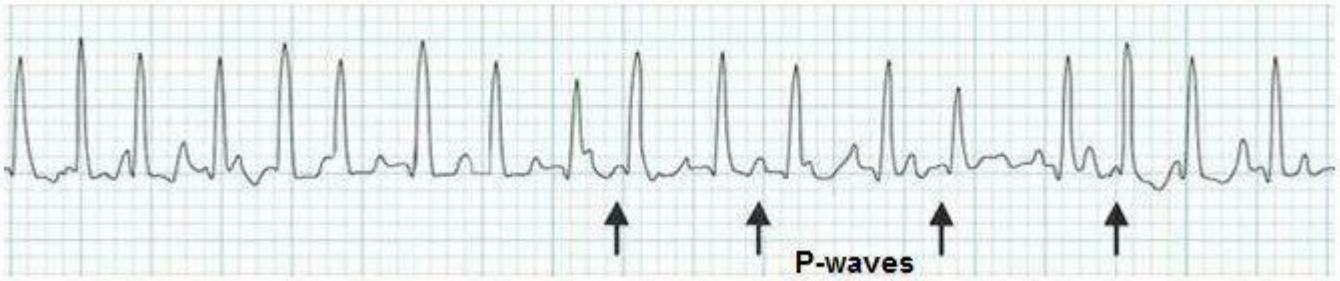


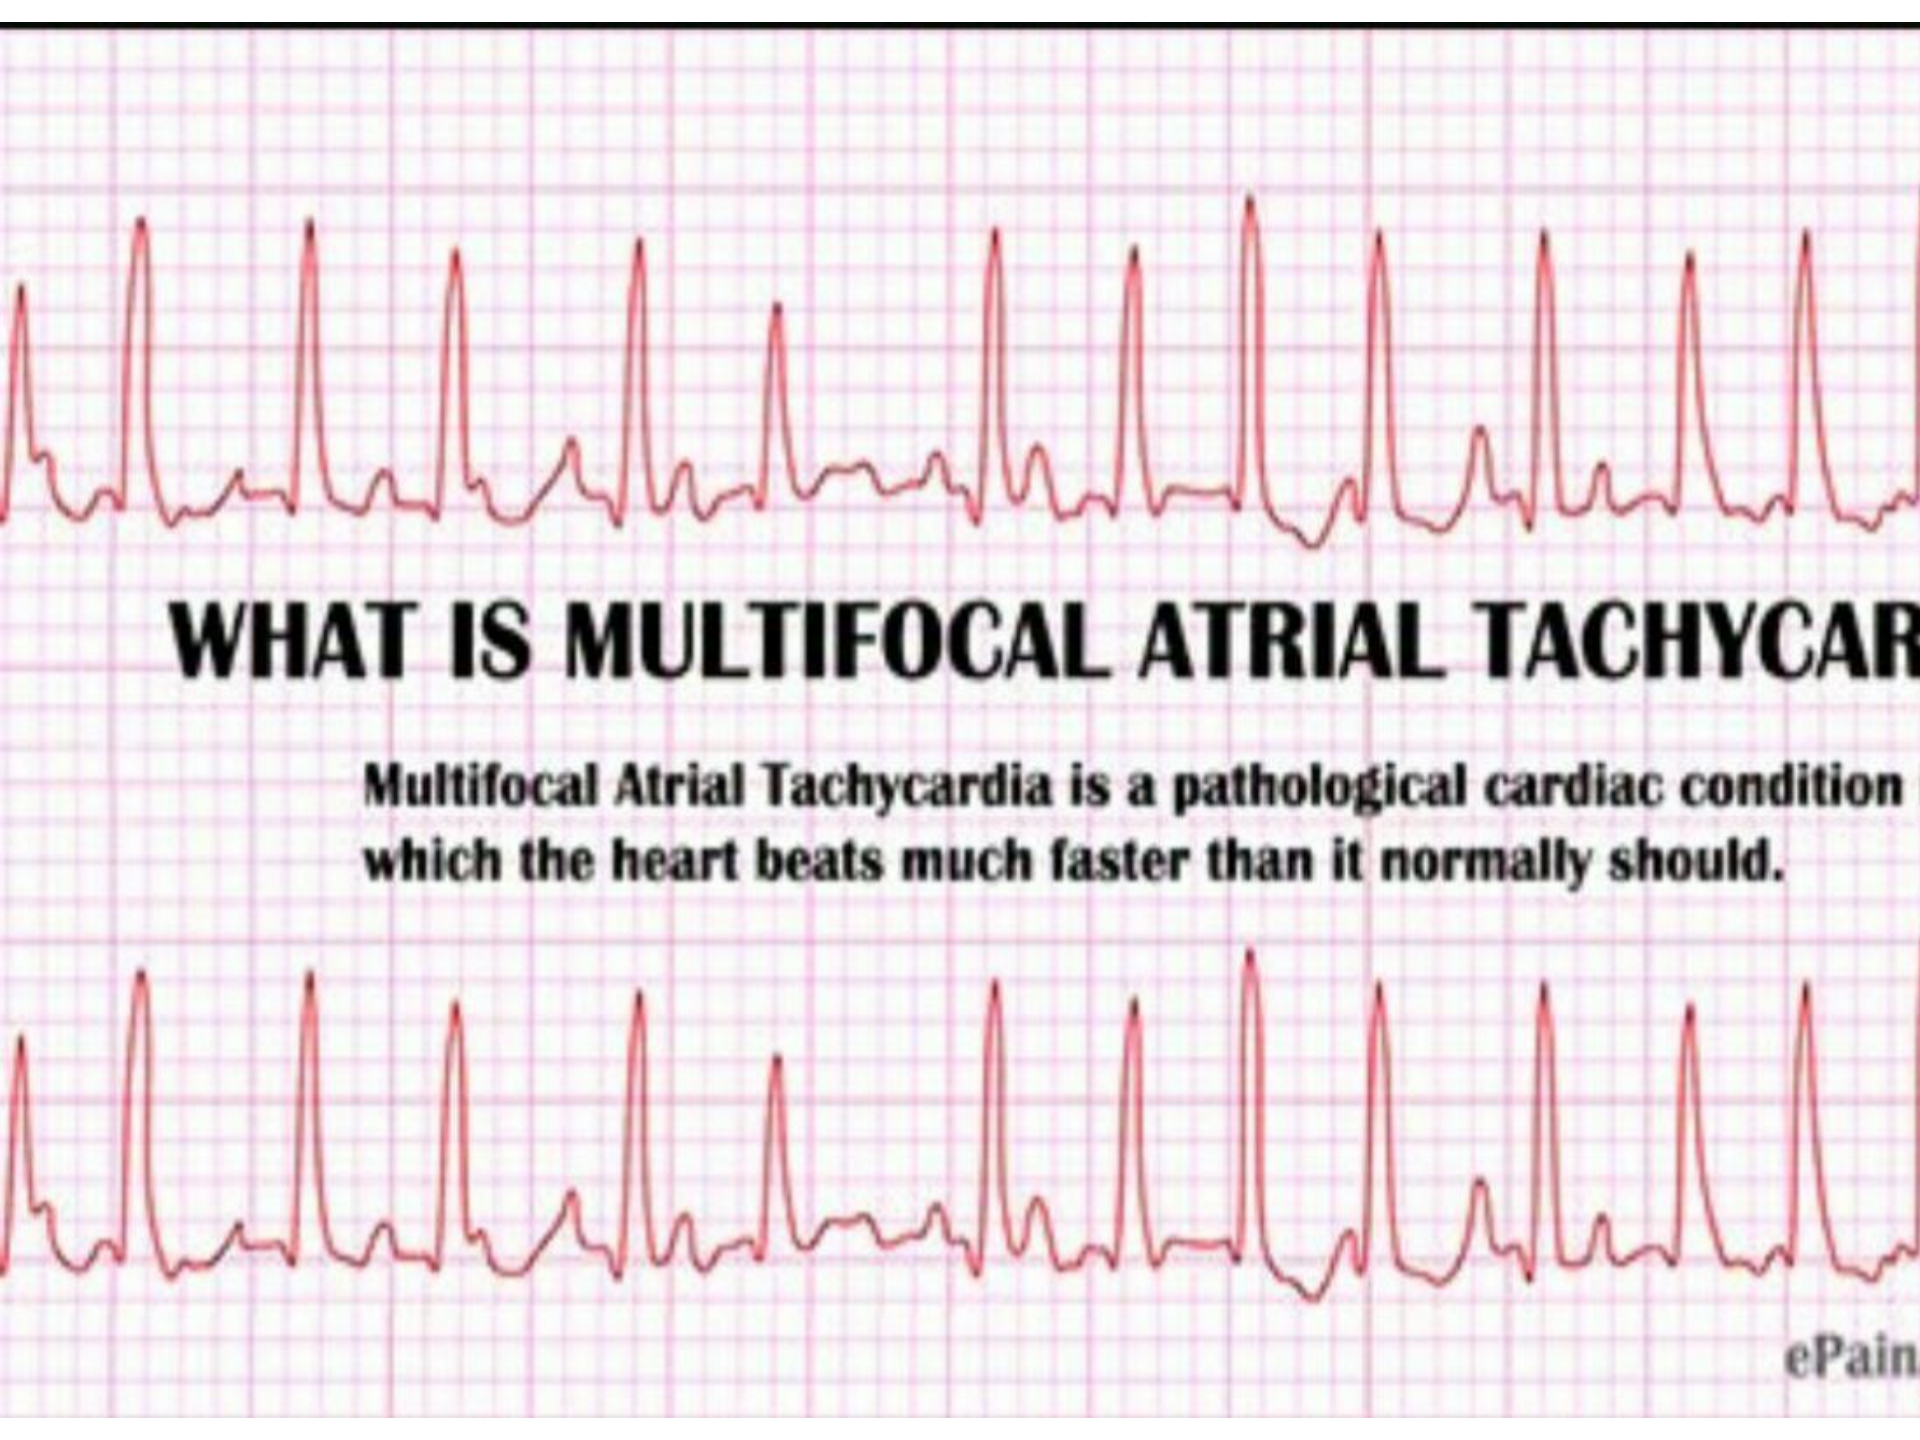
What's up with Multifocal Atrial Tachycardia ?



1. The SA node is not pacing the heart
2. Several groups of excitable cells in the atria compete to pace the heart
3. MAT has at least three or more different shaped P-waves.
4. MAT is an irregular rhythm above 100 bpm
5. MAT has irregular P-R, R-R and P-P intervals

Definition:
A rapid, irregular atrial rhythm arising from multiple ectopic foci within the atria.

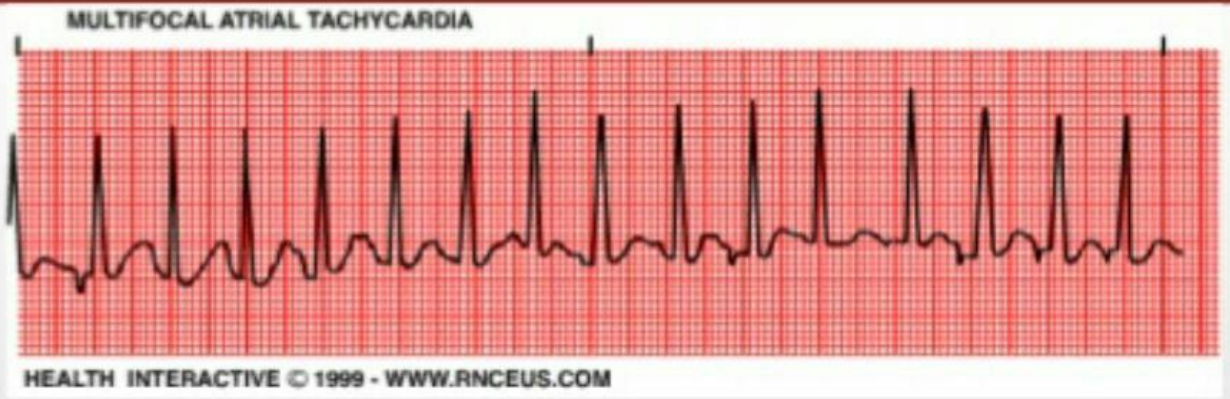




WHAT IS MULTIFOCAL ATRIAL TACHYCAR
Multifocal Atrial Tachycardia is a pathological cardiac condition
which the heart beats much faster than it normally should.
ePain

Multifocal Atrial Tachycardia (MAT)

(Rapid Wandering Pacemaker)

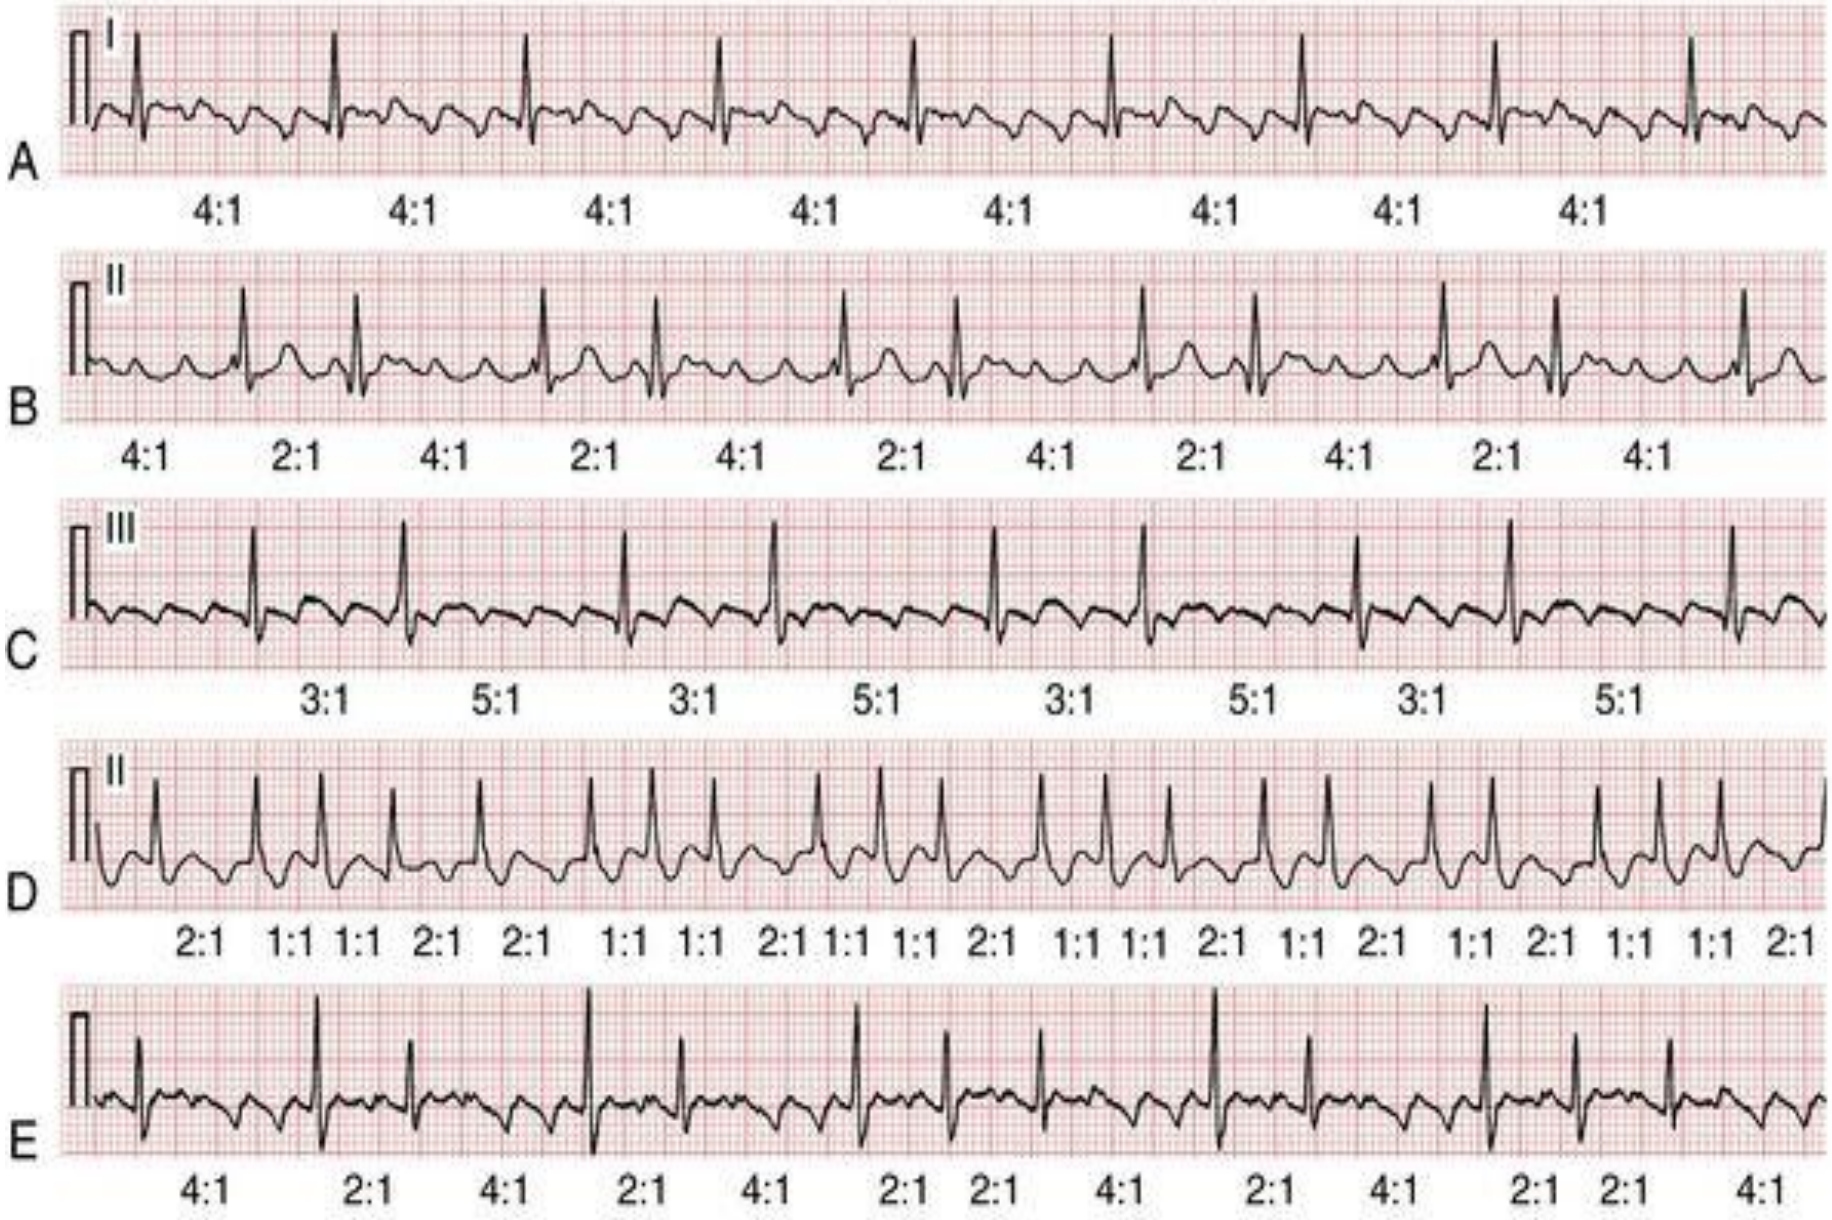


- Similar to wandering pacemaker (≤ 100)
- MAT rate is >100
- Usually due to pulmonary issue
  - COPD
  - Hypoxia, acidotic, intoxicated, etc.
- Often referred to as SVT by EMS
  - Recognize it is a tachycardia and QRS is narrow

📖 فلوتر دهلیزی (Atrial flutter) :

- ✔ نوعی آریتمی منظم دهلیزی با ریت ۲۶۰ تا ۳۰۰ ضربه در دقیقه است .
- ✔ در خط ایزوالکتریک لیدهای تحتانی حالت دندانه.اره.ای (Saw-tootch appearance) ایجاد می شود .
- ✔ اگر از هر ۲ انقباض دهلیـــزی یکی وارد بطن شود (2:1) ریت بطنـــی ۱۳۰ تا ۱۵۰ ضربه در دقیقه است اگر (3:1) باشد ریت بطنی حدود ۷۰ در دقیقه است .

Atrial Flutter with Variable AV Block



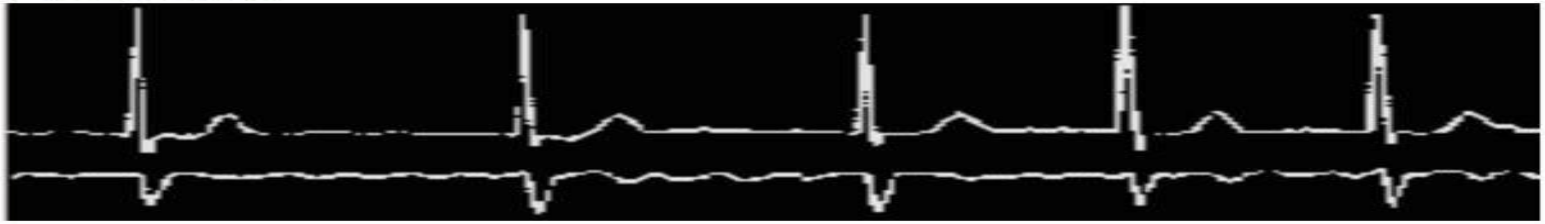
ECG III Rhythms and Traces

Atrial Flutter

Atrial rate 240-320/min. Ventricular rate varies with AV block 2:1. Saw tooth pattern (II, III, aVF, V1)

Atrial Fibrillation (AF)

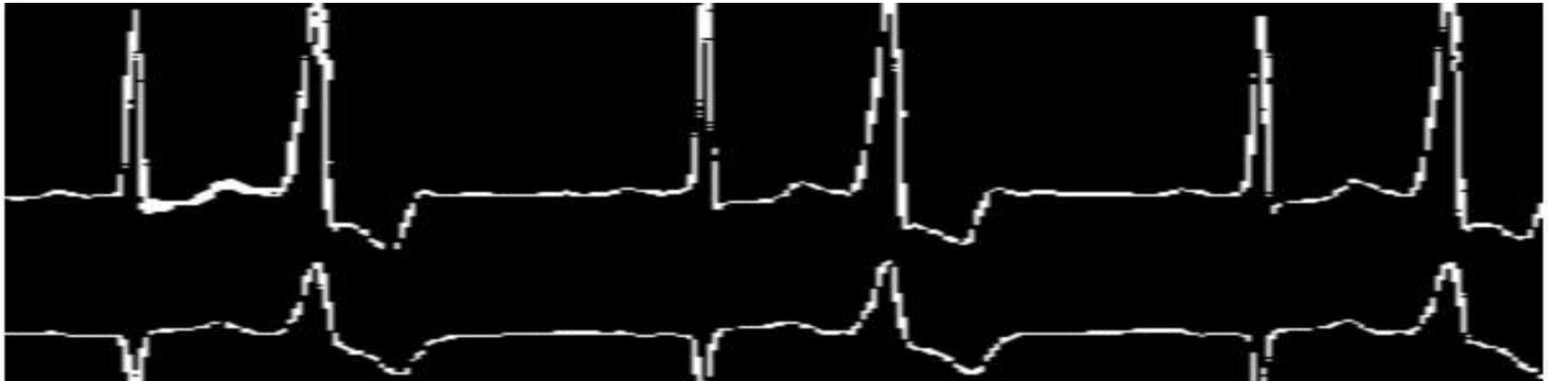
Highly irregular. No P wave. Vent. response: 160-200.min



-geminy

Bigeminy (coupled beat)

Sinus beat → PVC → PVC.



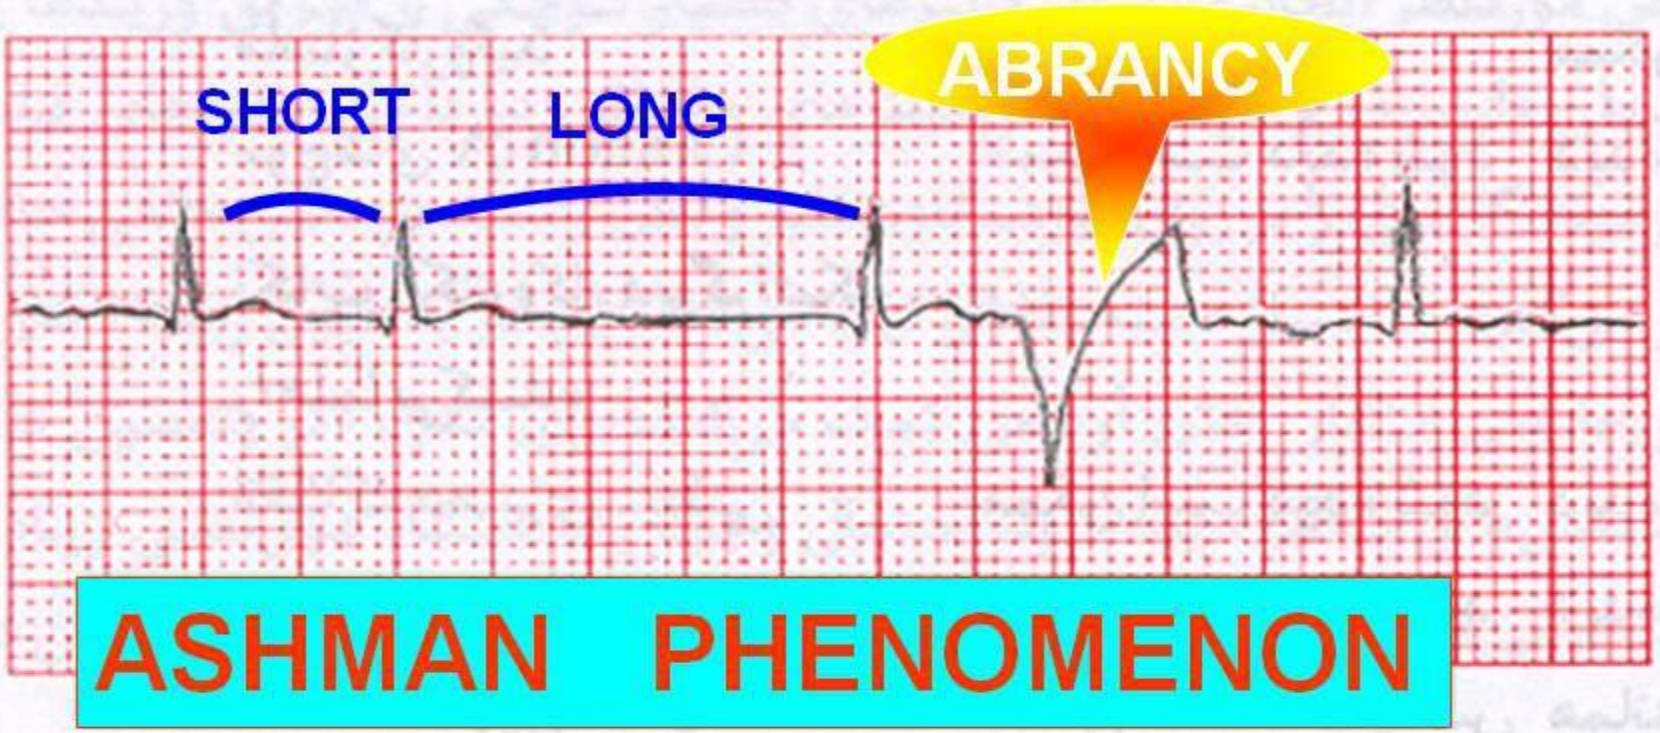
@emt_ems

ریتمهایی که دراحیاءشناخت آنها ضروریست

در ریتم های بالا اقدام اول بعد از مونیتورینگ شوک دادن به بیمار با بالاترین ژول انتخابی است

در ریتم های بالا اقدام اول بعد از مونیتورینگ،شروع ماساژ قلبی و تزریق اپی انفرین می باشد

@EMT_EMS



پدیدهٔ Ashman چهارمین ضربان به PVC شباهت دارد، اما می‌تواند یک ضربان فوق بطنی نیز باشد که در مسیری انحرافی هدایت شده است. به فیبریلاسیون دهلیزی زمینه‌ای توجه کنید و همچنین به فاصلهٔ کوتاهی که قبل از ضربان دوم وجود دارد، و فاصلهٔ بلندی که قبل از ضربان سوم وجود دارد. همهٔ اینها زمینه را برای بروز پدیدهٔ Ashman آماده می‌سازند.

آسیستول

مفهوم کلی: عدم وجود هرگونه فعالیت قلبی ، که شانس بقا ۰/۱ درصد میباشد

اقدامات : انجام CPR تا۵چرخه ،IV access ، اکسیژن تراپی ودارودرمانی

نکته: درصورت شک بین ریتمVF وآسیستول بجای انجام دفیبریلاسیون فشردن قفسه سینه بمدت ۲دقیقه توصیه میشود.

دارودرمانی : اپی نفرین

نکته : دراین نوع ریتم قلبی قبل ازهرگونه اقدام جهت مطمئن بودن ازریتم نشان داده شده بایستی اتصالات چک گردیده ودر۲لید دیگرنیز آسیستول تایید گردد

نکته : دستگاه ضربان ساز دیگر دردرمان آسیستول جایی ندارد.

نکته : درکودکان آسیستول وفعالیت الکتریکی بدون نبض نسبت به VF شایعتراست

- **VT management:**

Unstable:
Shock

stable

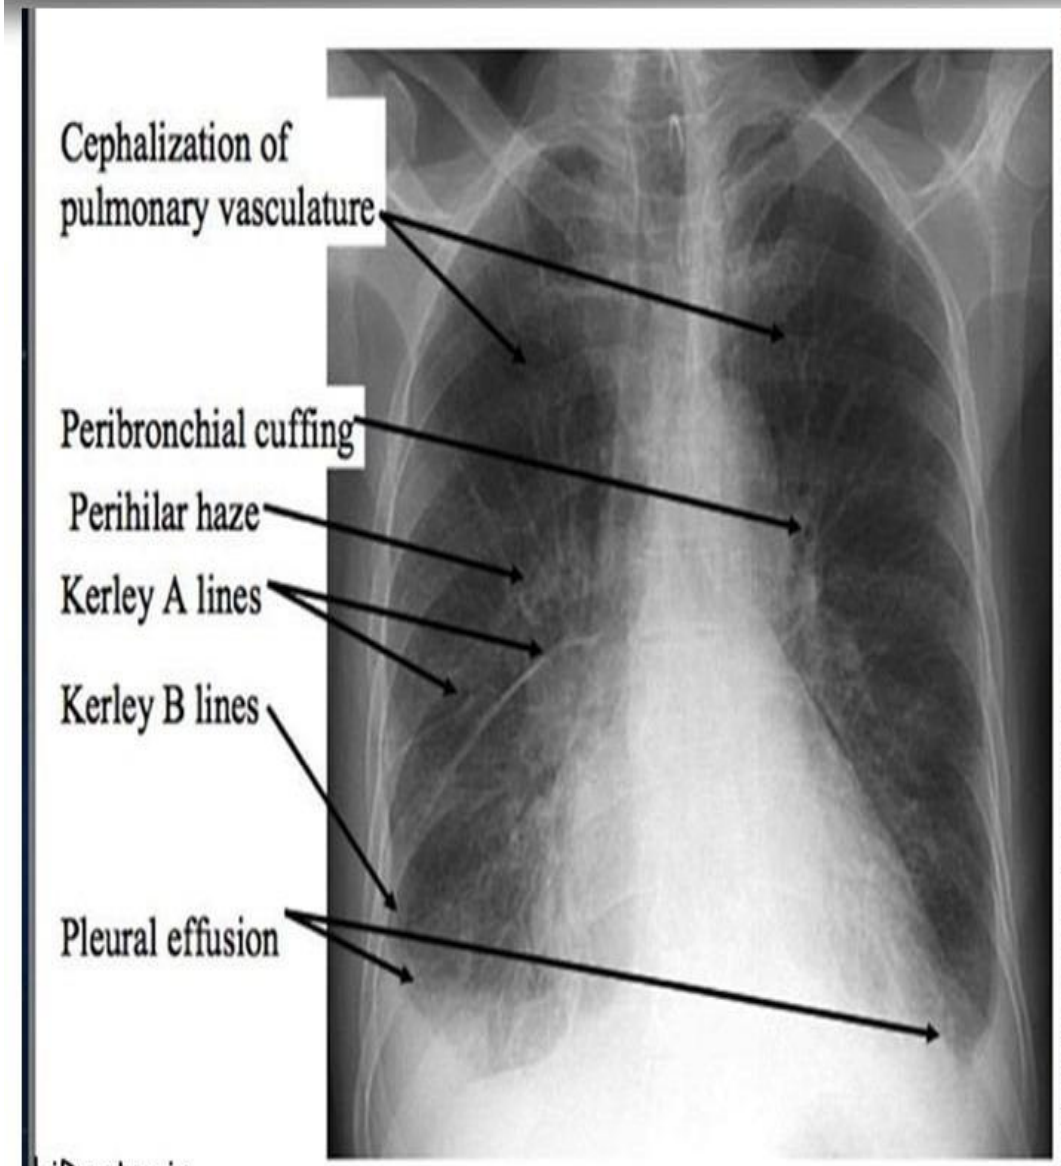
Amiodaron
initial doses 150mg stat (15 mg/min for 10 minutes), followed by 1 mg/min for 6 hours and then 0.5 mg/min for the remaining 18 hours
⊙ we can repeated loading dose another 150mg as needed

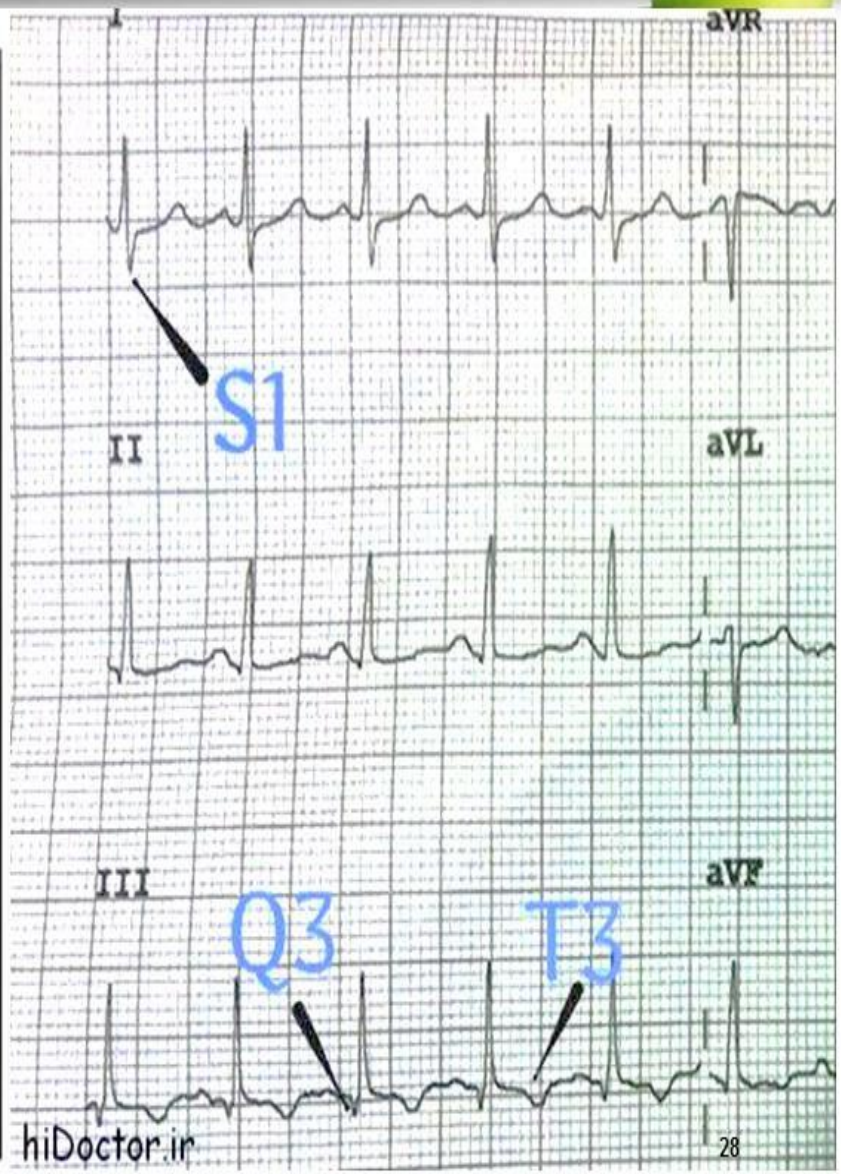
lidocaine:
1 to 1.5 mg/kg; repeat with 0.5 to 0.75 mg/kg every 5 to 10 minutes as necessary (maximum cumulative dose: 3 mg/kg). Follow with continuous infusion of 1 to 4 mg/minute (or 14 to 57 mcg/kg/minute).

Procainamide
Loading dose: Infuse 20 to 50 mg/minute or 100 mg every 5 minutes until arrhythmia controlled, hypotension occurs, QRS complex widens by 50% of its original width, or total of 17 mg/kg is given.
Follow with a continuous infusion of 1 to 4 mg/minute.

- @DRMVP

آمبولی ریه





چون ترومبوز در DVT کوچکتر است). در موارد شک بالینی که به DVT، در بیش از ۹۰٪ موارد DVT وجود نداشته و D-dimer منفی است. در بیش از ۹۵٪ کسانی که PTE ندارند، D-dimer منفی است.

۲- ABG : به تشخیص آمبولی کمک زیادی نمی‌کند. ABG معمولاً نشاندهندهٔ آلکالوز تنفسی در بیمار است (به علت تاکی‌پنه) اغلب هم PO_2 و هم PCO_2 کاهش دارد.

۳- EKG نیز به تشخیص کمک زیادی نمی‌کند. شایعترین یافته در آن تاکیکاردی سینوسی است. ممکنست در درصد کمی از بیماران right axis deviation و RBBB مشاهده شود. به ندرت الگوی تیپیک S1Q3T3 ایجاد می‌شود (S عمیق در لید I، Q پاتولوژیک و T معکوس در لید III) در لیدهای V1-V4 نیز ممکن است T invert دیده شود.

۴- CXR اغلب در آمبولی ریه نرمال است. در تنگی نفس ناگهانی و CXR نرمال، در قدم اول باید آمبولی رد شود.

علائم زیر ممکنست در گرافی دیده شوند:

- علامت **Westermark** (اولیگمی در قسمتی از ریه)
- علامت **Humpton** (یک wedge consolidation که قاعده آن بر روی پلور یا دیافراگم است)
- علامت **Palla** (بزرگتر شدن شریان پولمونر راست)

In a patient who has suffered a pulmonary embolus there may be transient non-specific changes in the patient's ECG:

- often no changes are seen on the ECG
- classical changes are S1, Q3, T3

The detailed changes are as follows:

- tall R waves in V1
- P pulmonale (peaked P waves) best seen in the inferior leads
- there may be right axis deviation and clockwise rotation
- atrial arrhythmias may occur
- there may be T wave inversion in the leads V1, V2, V3
- possible right bundle branch block
- there may be a shift of transition point to the left, so that the R wave equals the S wave in V5 or V6 rather than V3 or V4
- in this condition there is often a Q wave in lead 3, resembling an inferior infarction
- right ventricular strain is very occasionally seen, causing an S wave in lead I, Q wave and inverted T wave in lead III
    - right ventricular strain pattern on ECG is associated with adverse short-term outcome and adds incremental prognostic value to echocardiographic evidence of right ventricular dysfunction in patients with acute pulmonary embolism and normal blood pressure (1)

CLASSIFICATION	PRESENTATION	THERAPY
Massive PE	Systolic blood pressure <90 mm Hg or poor tissue perfusion or multisystem organ failure plus right or left main pulmonary artery thrombus or "high clot burden"	Thrombolysis or embolectomy or inferior vena caval filter plus anticoagulation
Submassive PE	Hemodynamically stable but moderate or severe right ventricular dysfunction or enlargement	Addition of thrombolysis, embolectomy, or filter remains controversial
Small to moderate PE	Normal hemodynamics and normal right ventricular size and function	Anticoagulation

Web Table 3 Approved thrombolytic regimens for pulmonary embolism

Streptokinase	250 000 IU as a loading dose over 30 minutes, followed by 100 000 IU/h over 12–24 hours
	Accelerated regimen: 1.5 million IU over 2 hours
Urokinase	4400 IU/kg as a loading dose over 10 min, followed by 4400 IU/kg per hour over 12–24 hours
	Accelerated regimen: 3 million IU over 2 hours
rtPA	100 mg over 2 hours; or
	0.6 mg/kg over 15 minutes (maximum dose 50 mg)

IU = international units; rtPA = recombinant tissue plasminogen activator.

Osborne Waves or "J-Waves"

Here we see the Osborn waves of severe hypothermia (blue arrows).

The rhythm is atrial fibrillation.

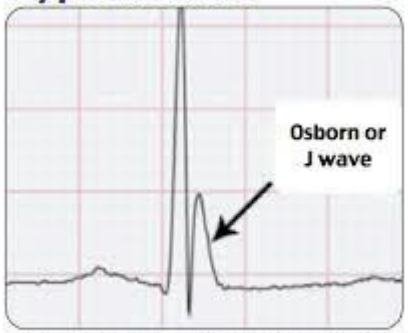
Bradycardia is present.

The QT/QTc is prolonged.

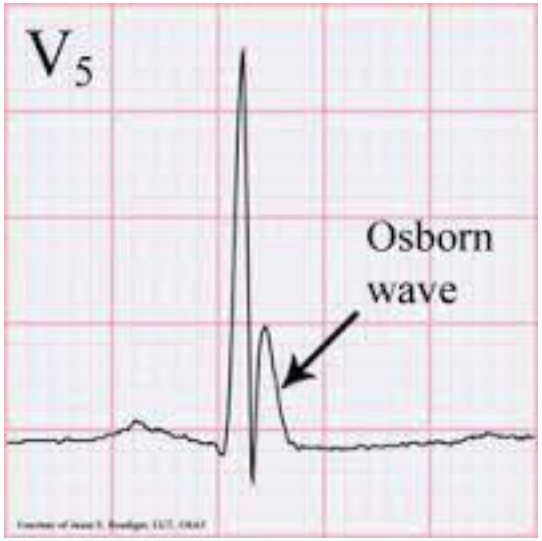
The patient's core temperature was measured at 76°F (24°C).

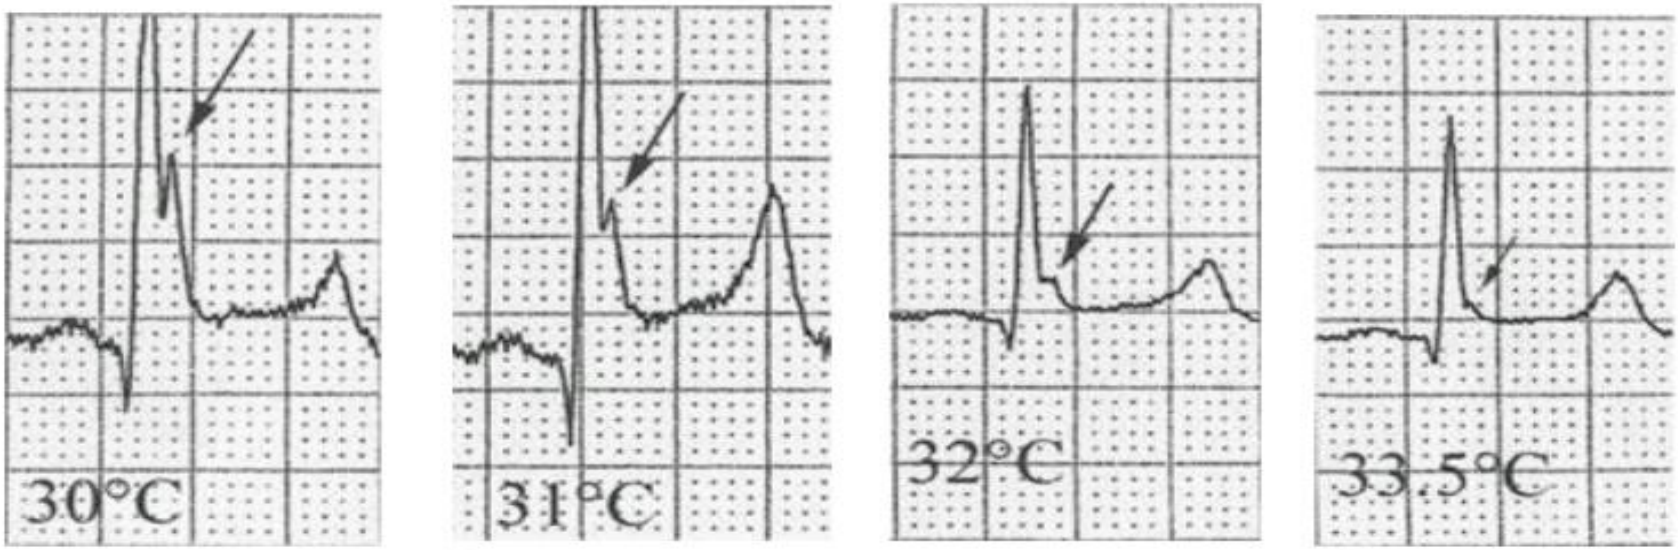
V2
V3

Hypothermia



- Size of wave correlates with degree of hypothermia
- Typically appears below 32°C
- Usually resolves with warming
- No prognostic value





ECGs 3.23a–3.23d

ECG monitor lead: Osborn wave in a 53-year-old patient during open heart surgery. The Osborn wave and ST depression gradually diminishes during increasing body temperature.

فیبریلاسیون بطنی

مفهوم کلی: آشفتگی کامل قلبی درنتیجه فعالیت مناطق متعددقلبی باسرعت زیاد بدون دخالت هرگونه فعالیت سازمان یافته میباشد این ریتم شایعترین ریتم قابل شوک دادن دربزرگسالان است.

- این ریتم درکودکان ممکن است بیان کننده مسمومیت دارویی، اختلالات الکترولیتی وبیماریهای مادرزادی قلبی باشدد.
- دراین نوع ریتم برون ده قلبی وجود ندارد

اقدامات : استفاده ازدفیبریلاتور، IV access ، اکسیژن تراپی وداروودرمانی وCPR

بزرگسالان : مونوفازیک۳۶۰ وبای فازیک با ۲۰۰- ۱۲۰ ژول شروع میشود درفیبریلاسیون دهلیزی بای فازیک۱۲۰ ژول ومونوفازیک ۲۰۰ژول میباشد

کودکان : درشوک اول 2J/KG وبدنبال آن4J/KG ودرشوکهای بعدی تا10J/KG وحتی تا اندازه بزرگسالان هرکدام که کمتر باشد ادامه می یابد.

داروودرمانی: اپی تفرین پس ازشوک دوم و آمیوداروون ولیدوکائین پس ازشوک سوم

Cardioversion

- Alive, unstable, tachyarrhythmia
- Unstable?
  - Signs of low cardiac output: systolic hypotension < 90 mmHg, altered mental status
  - Excessive rates >150/min
  - Chest pain
  - Heart failure
- Synchronized cardioversion is shock delivery that is timed (synchronized) with the QRS complex

Factor	V-Tach	SVT with Aberrancy
Age	>50	<35
History	MI, CHF, CABG, MVR	MVR, WPW

QRS morphology	V1 - R or qR	V1 - rsR'
(RBBB-like pattern)	V6 - rS	V6 - R(slurredS)

نکات مهم و دوزها در تاکیکاردی با نبض بزرگسالان

- **کاردیوورژن سینکرونایز**

دوز های توصیه شده برای شروع : (با روشن کردن دکمهٔ sync دستگاه دفیبریلاتور)

- باریک و منظم : ۵۰ تا ۱۰۰ ژول • باریک و نامنظم : ۱۲۰ تا ۲۰۰ژول بای فازیک یا ۲۰۰ژول مونوفازیک
- پهن و منظم : ۱۰۰ژول • پهن و نا منظم : دوز دفیبریلاسیون(غیرسینکرونایز)

- **دوز IV آدنوزین :** دوز اول 6mg به صورت تزریق سریع وریدی و به دنبال آن تزریق 20cc N/S

دوزدوم درصورت نیاز 12 mg

- **دوز IV کلسیم کانال بلاکر ها :**
  - **وراپامیل** با دوز 2.5-5mg بلوس درعرض ۲دقیقه وتکرارآن هر۱۵تا ۳۰دقیقه 5-10mg تا سقف دوز 20 mg
  - **دیلتیازم** با دوز 15-20mg درعرض۲ دقیقه و در صورت عدم تأثیر 25-30mg درعرض ۱۵ دقیقه و دوز انفوزیون 5-15 mg/hour
- **دوز IV ایندرال :** 0.1mg/kg با تقسیم در ۳ دوز مساوی و هر ۲ تا ۳ دقیقه به صورت آهسته و رقیق شده تزریق می شود.(نکته : سرعت تزریق ایندرال نباید از 1mg/min بیشتر باشد ، ضمنا تجویز بتابلاکرها در بیماران ریوی و CHF باید با احتیاط صورت گیرد.)

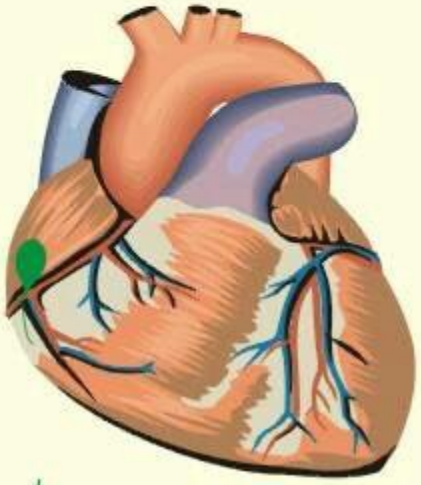
- **انفوزیون آنتی آریتمی برای تاکیکاردی پایدار باQRS پهن :**
  - **دوزIV پروکائین آمید :** 20-50mg/min تا ازبین رفتن آریتمی ، ایجاد هیپوتانسیون ، افزایش بیش از ۵۰% زمان QRS یا سقف دوز 17mg/kg
  - **دوزIV آمیودارون :** دوز اول 150mg درعرض ۱۰دقیقه

وتکرار درصورت برگشت VT و بدنبال آن انفوزیون 1mg/min برای ۶ ساعت اول

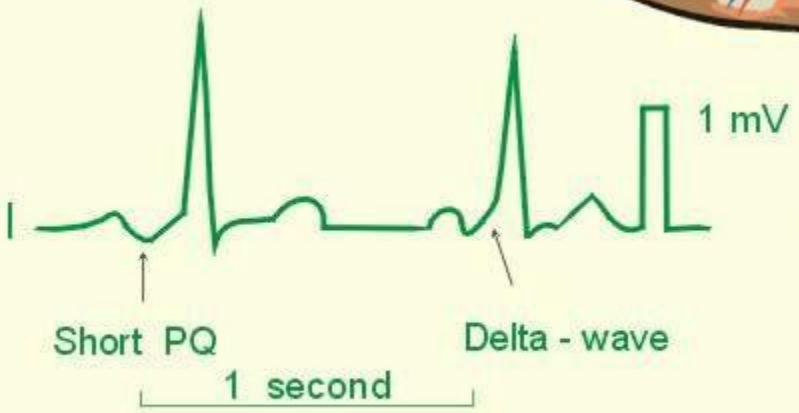
- **دوز IV سوتالول :** 100mg(1.5mg/kg) در عرض ۵ دقیقه و پرهیز از تجویز آن در صورت QT طولانی

Defibrillation	Cardioversion
Not synchronised	Synchronised on the R wave
For cardiac arrest	For periarrest tachyarrhythmias (unstable)
Higher energy joules	Lower energy joules
No escalating energy for next shock	Escalate for next shock (100 - 200 - 300 - 360J)

WPW- Block & Long Qt-syndrome



WPW - Block



The Long Q T - Syndrome

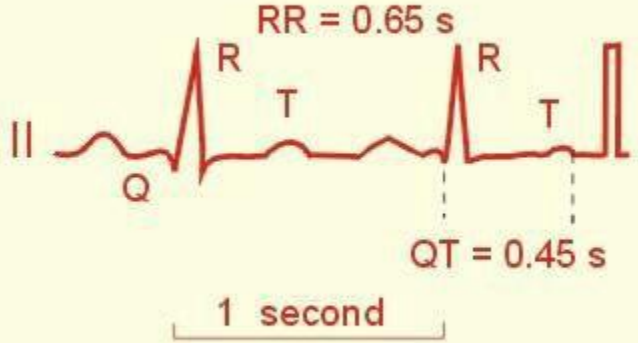


Fig. 11-14

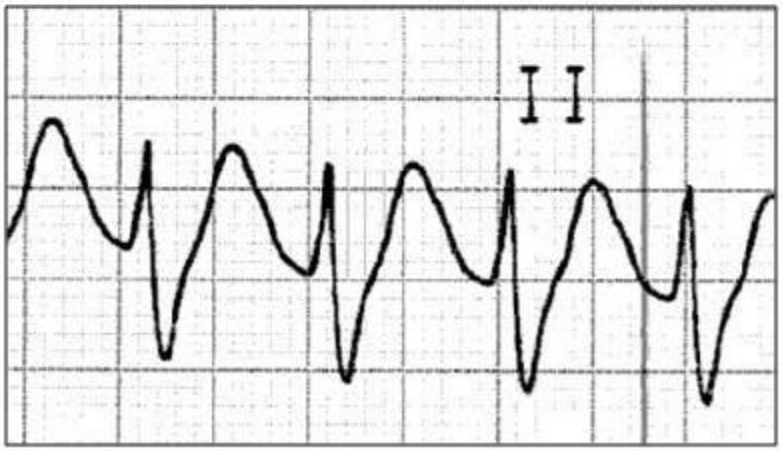
KMc

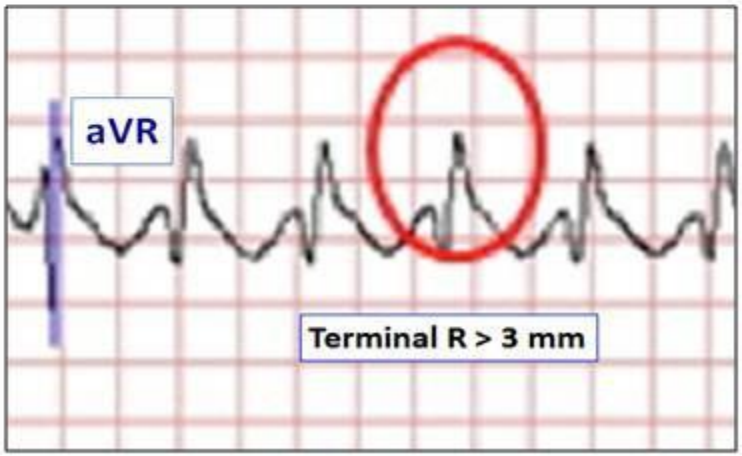
Tricyclic Overdose (Sodium-Channel Blocker Toxicity)

- **sodium-channel blocking** medications such as:
  - Tricyclic antidepressants (= **most common**)
  - Type Ia antiarrhythmics (quinidine, procainamide)
  - Type Ic antiarrhythmics (flecainide, encainide)
  - Local anaesthetics (bupivacaine, ropivacaine)
  - Antimalarials (chloroquine, hydroxychloroquine)
  - Dextropropoxyphene
  - Propranolol
  - Carbamazepine
  - Quinine

ECG Findings Tricyclic Overdose

- Interventricular conduction delay (IVCD) — QRS > 100 ms in lead II
- Right axis deviation (RAD)
- Terminal R wave > 3 mm in AVR
- R/S ratio > 0.7 in AVR





Clinical Features of Tricyclic Overdose

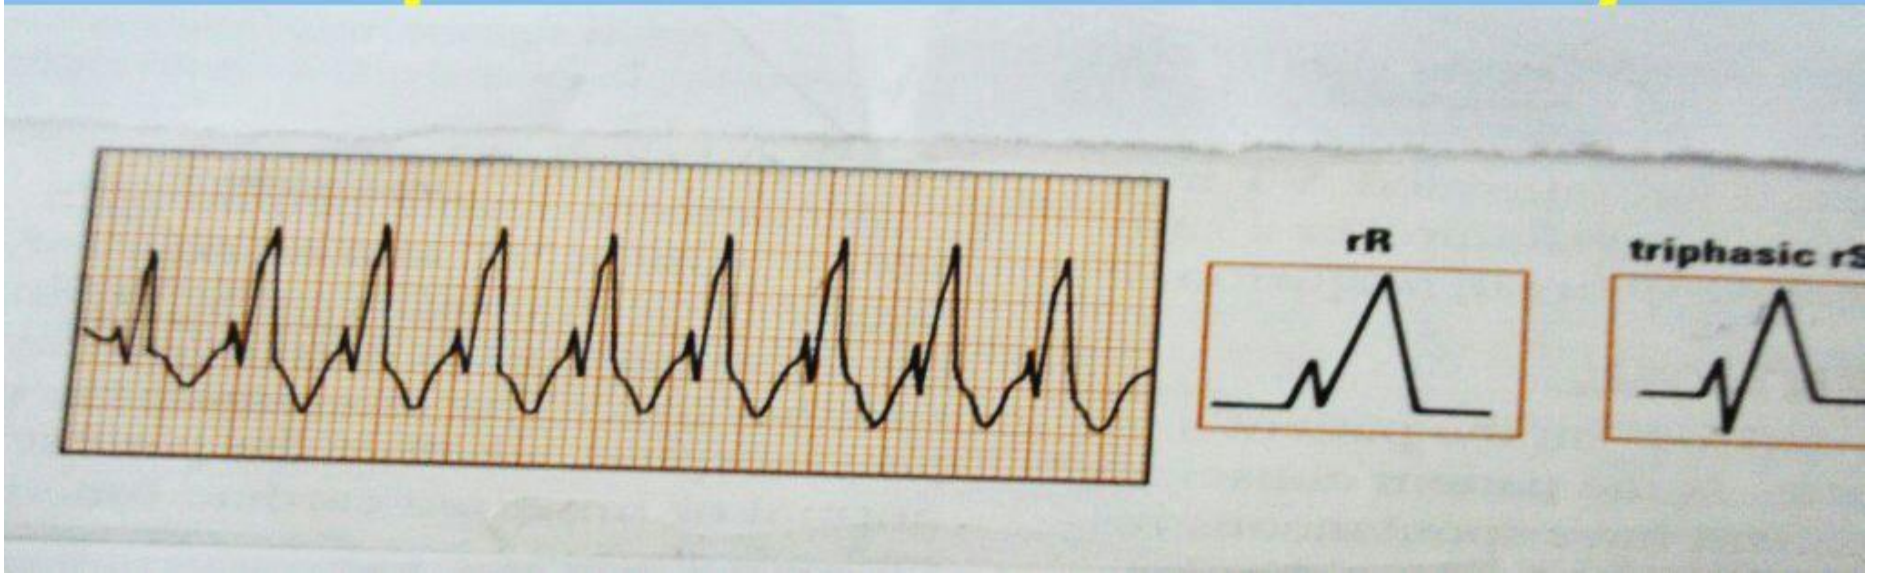
In overdose, the tricyclics produce rapid onset (within 1-2 hours) of:

- Sedation and coma
- Seizures
- Hypotension
- Tachycardia
- Broad complex Dysrhythmia
- Anticholinergic syndrome

In V_1 or MCL_1 If wide and positive QRS

If the QRS complex is triphasic similar to a RBBB

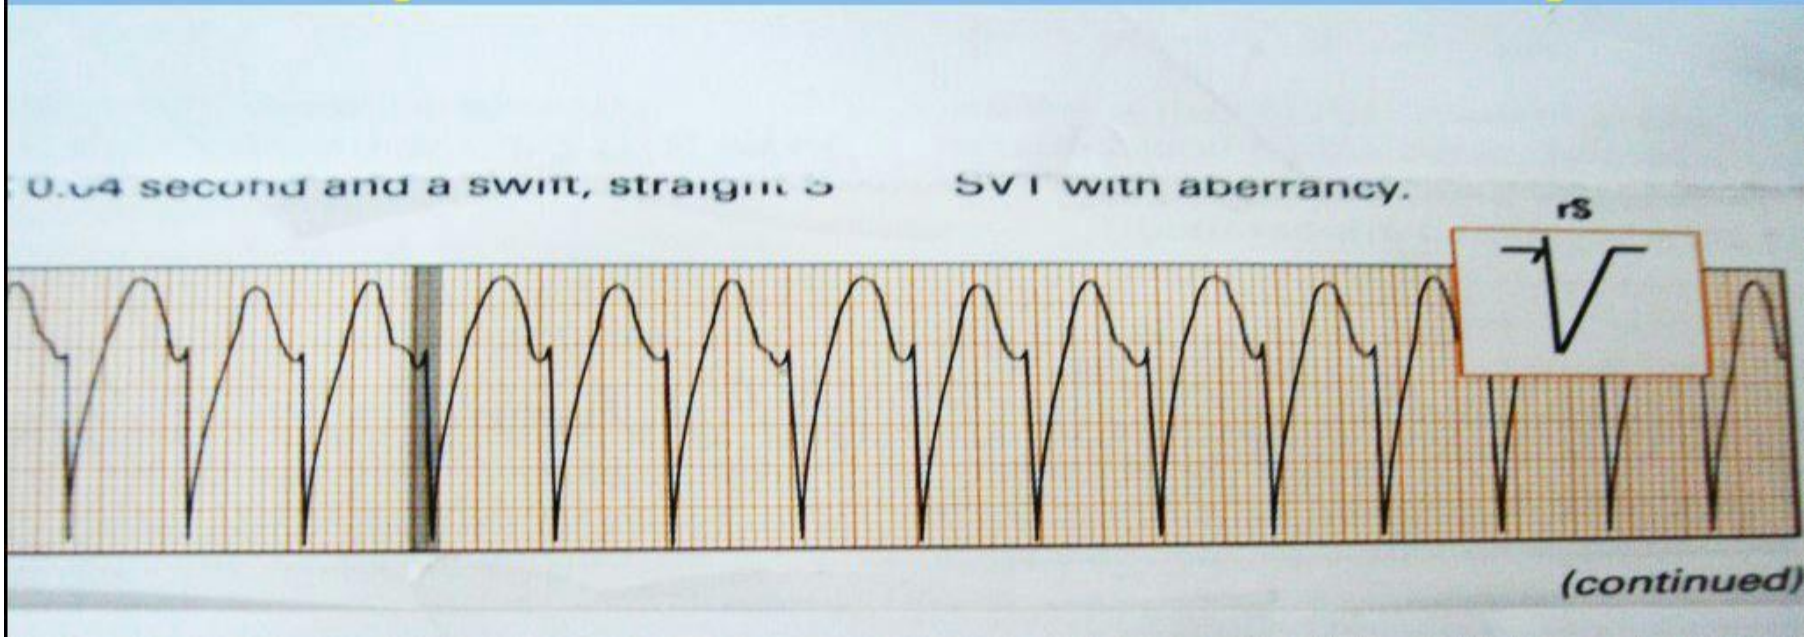
Suspect SVT with aberrancy



In V_1 or MCL_1 If wide and negative QRS

- If the QRS complex has an R wave < 0.04 s and swift and straight on the downstroke

Suspect SVT with aberrancy



In V_1 or MCL_1 If wide and positive QRS

If the QRS complex is tall and shaped like rabbit ears with the left peak taller than the right and monophasic QRS

Suspect VT

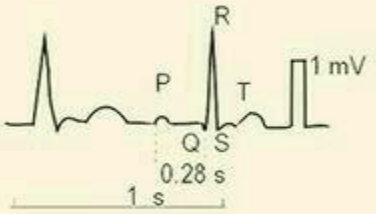
The Heart Block Poem

by the Princeton Surgical Group & nursesLabs

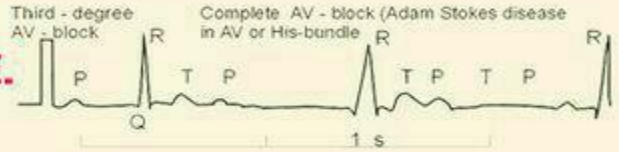
If the **R** is far from **P**,
then you have a **FIRST DEGREE**.



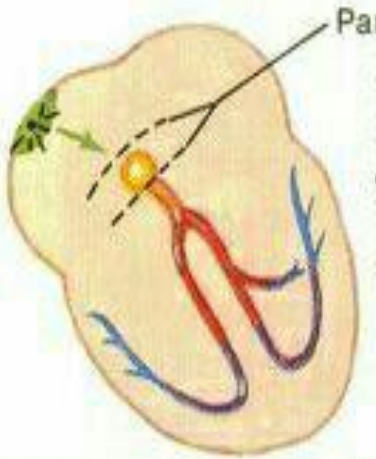
Longer, longer, longer, drop!
Then you have a **WENKEBACH**.

If some **P**s don't get through,
then you have **MOBITZ II.**

If **P**s and **Q**s don't agree,
then you have a **THIRD DEGREE.**



1° AV Block



Rhythm: regular

Rate: (that of underlying rhythm)

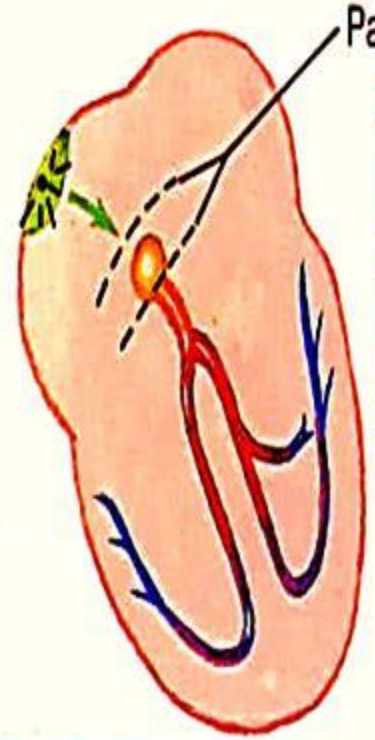
PRI is > than .2 seconds

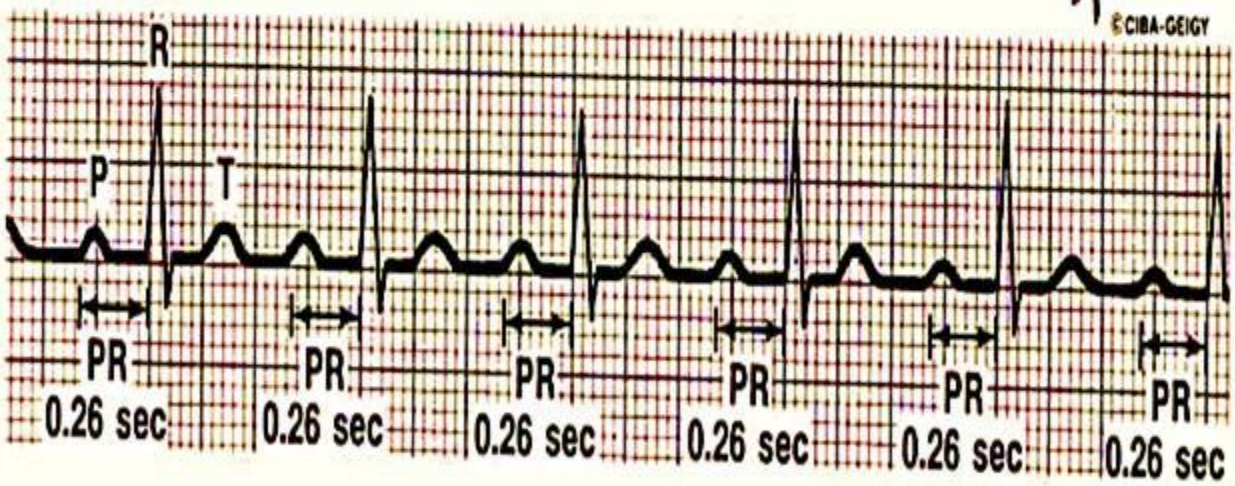
QRS: usually normal

AVB I

D. Fixed but prolonged PR interval

First-degree AV block





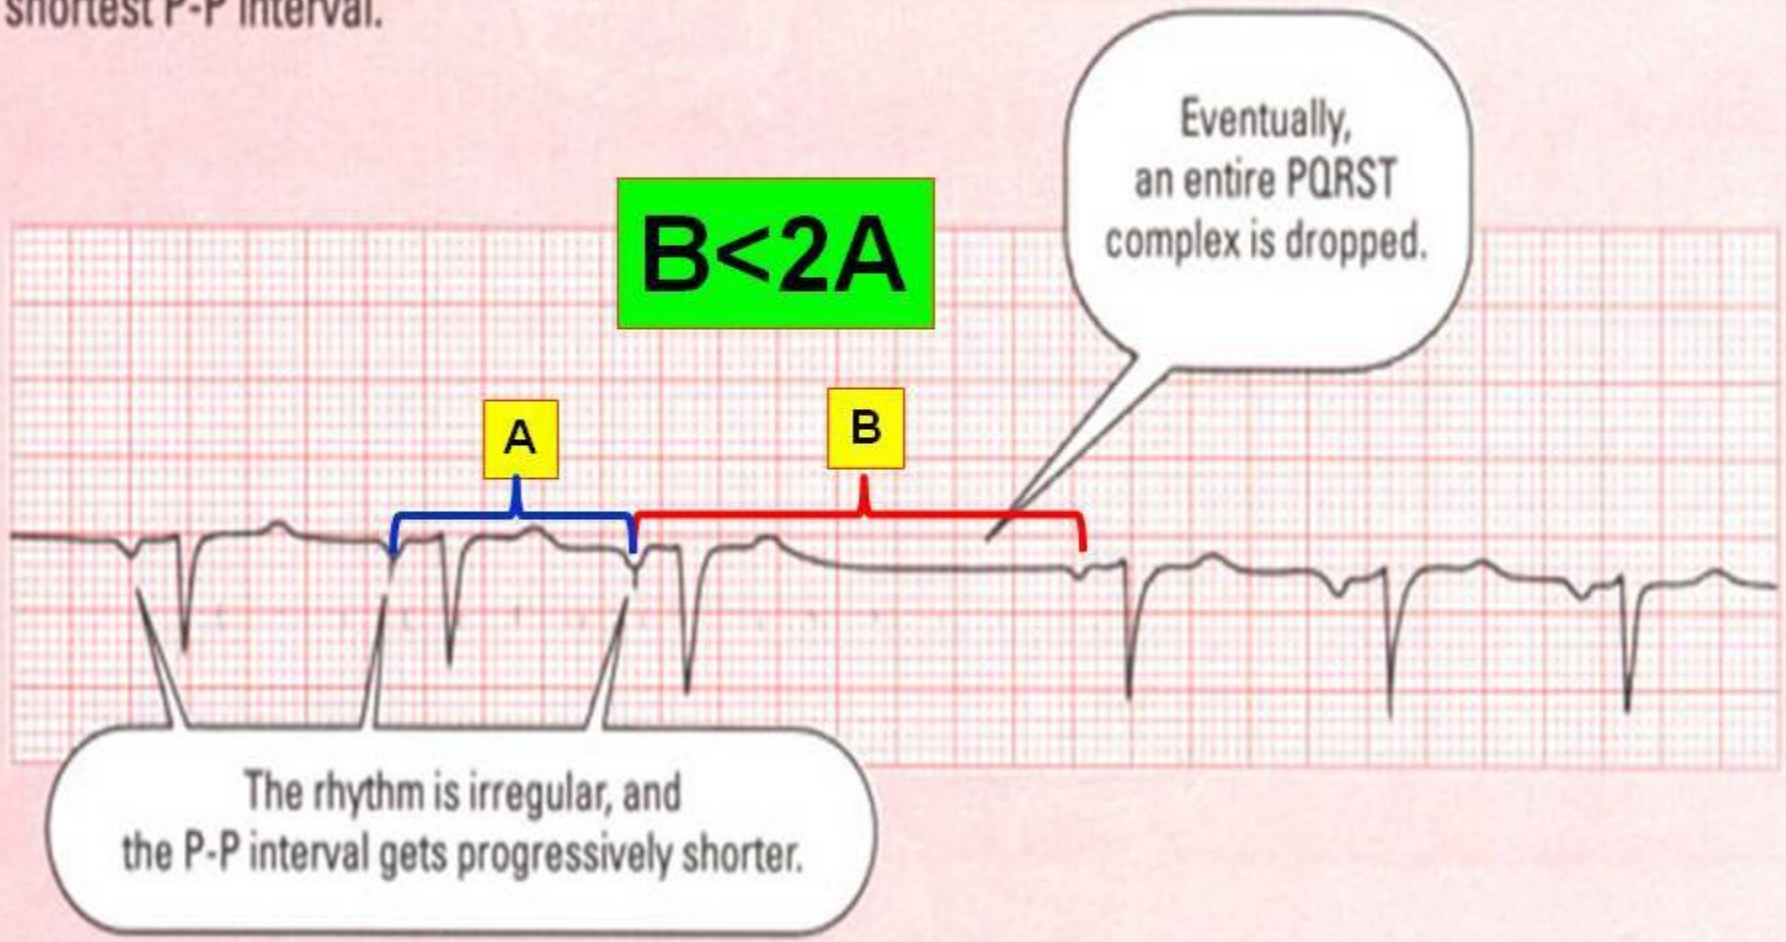
F. Netter M.D.

©CIBA-GEIGY

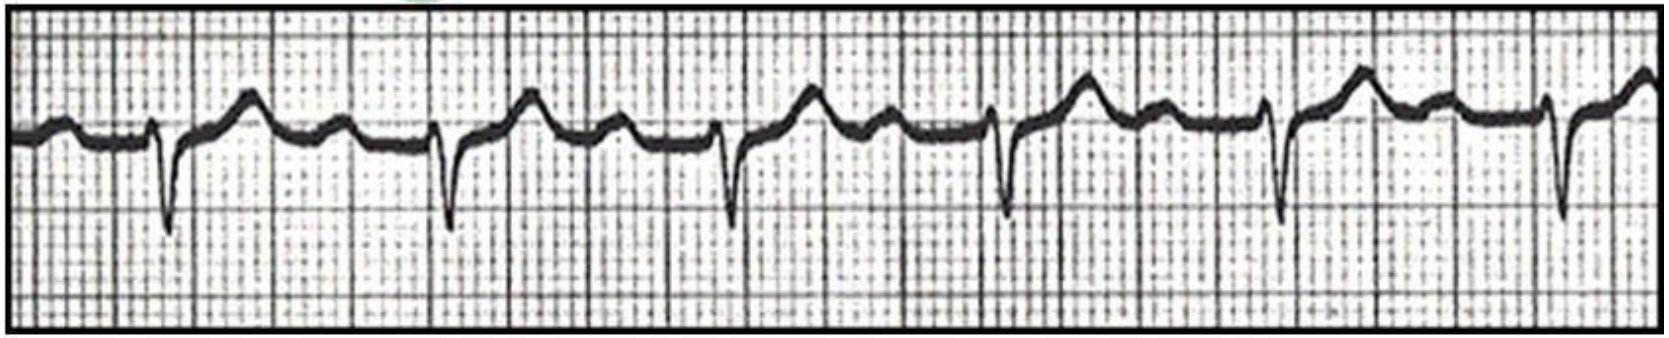
P wave precedes each QRS complex but PR interval, although uniform, is >0.2 second (>5 small boxes)

Second-degree type I block

In this type of SA block, conduction time between the sinus node and the surrounding atrial tissue becomes progressively longer until an entire cycle is dropped. The pause is less than twice the shortest P-P interval.



1st Degree AV Block



EKG Characteristics: Prolongation of the PR interval, which is constant

All P waves are conducted

2nd Degree AV Block

Type 1
(Wenckebach)

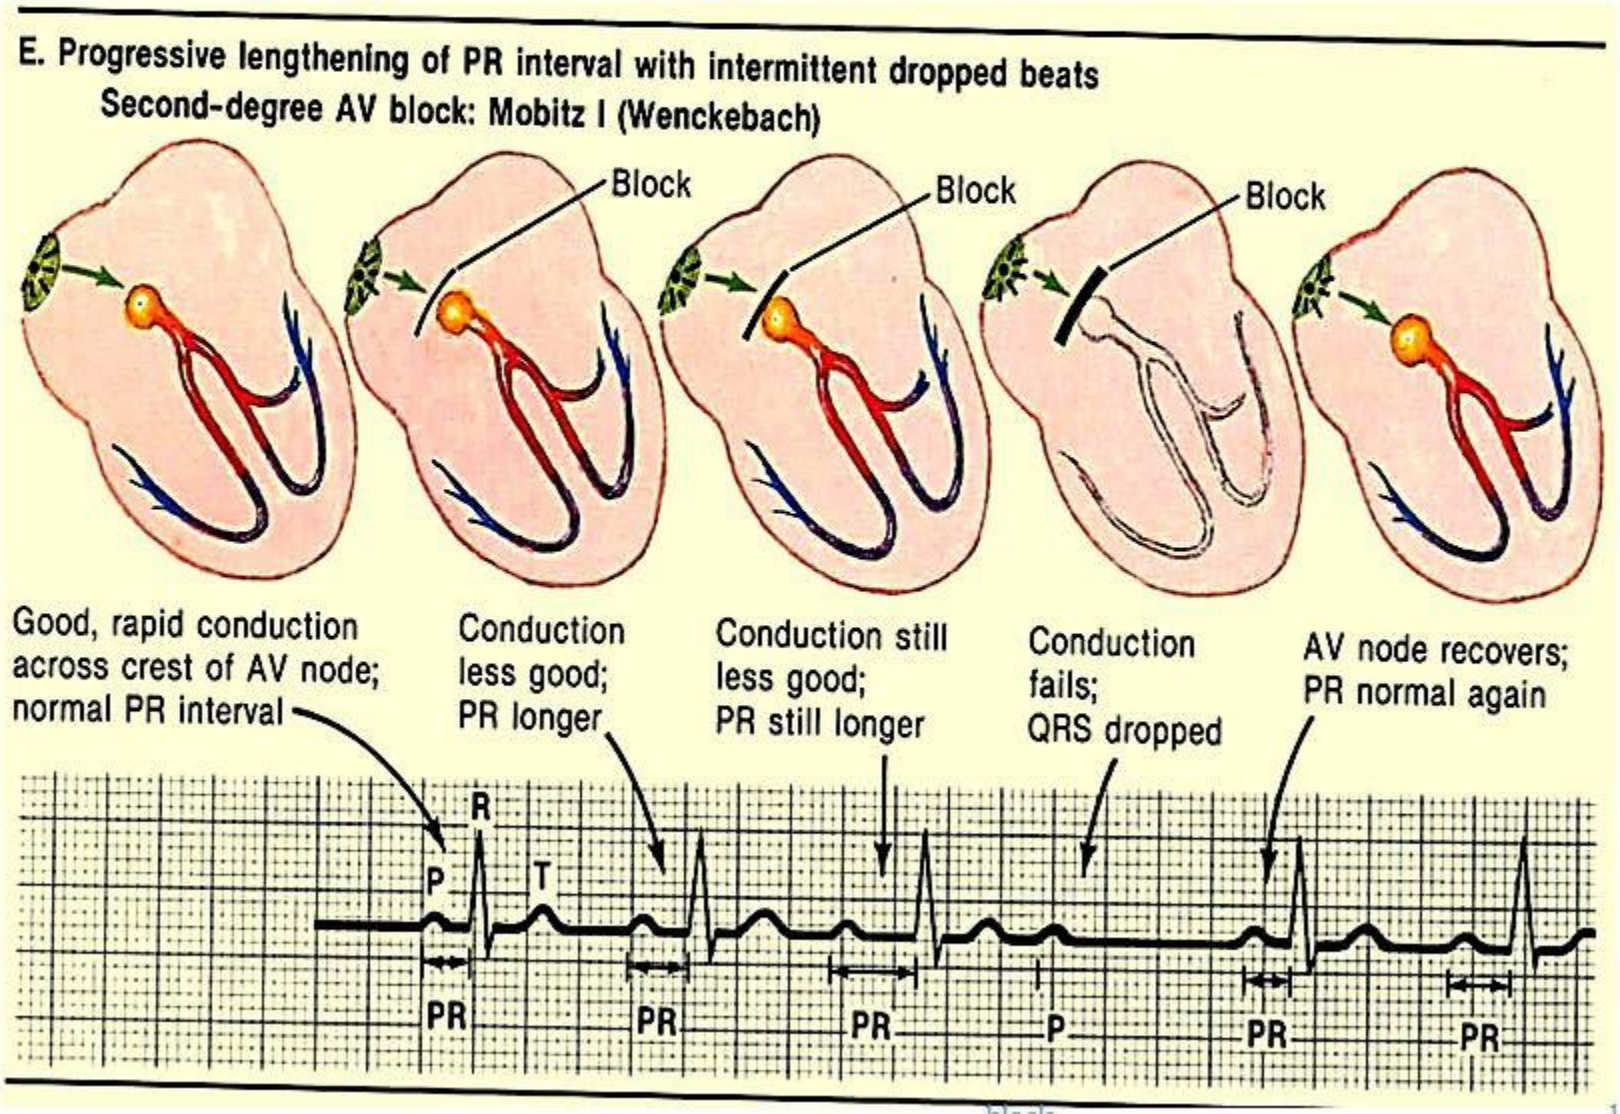
EKG Characteristics: Progressive prolongation of the PR interval until a P wave is not conducted.

As the PR interval prolongs, the RR interval actually shortens

Type 2

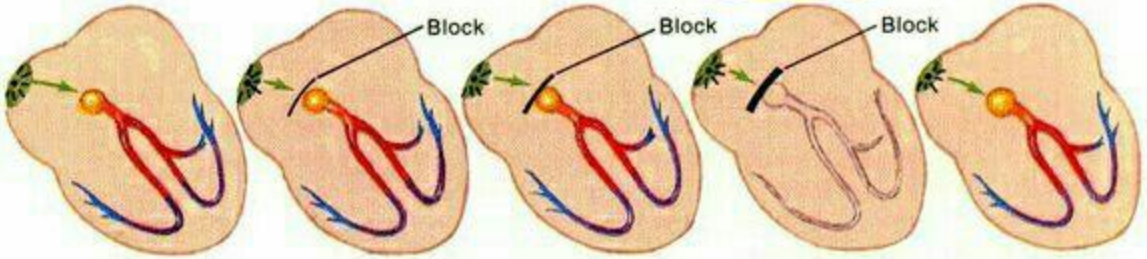
EKG Characteristics: Constant PR interval with intermittent failure to conduct

بلوك درجه II (ونكباخ)

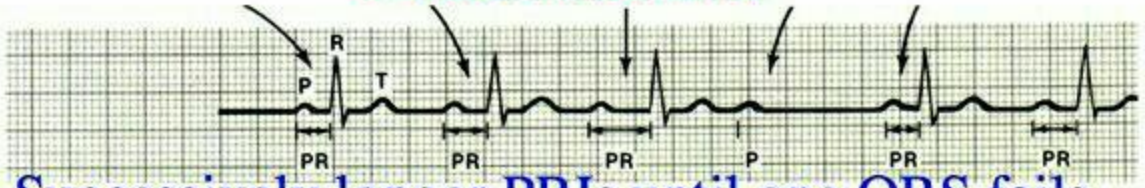


2° AV Block Mobitz I

گروه پرستاران



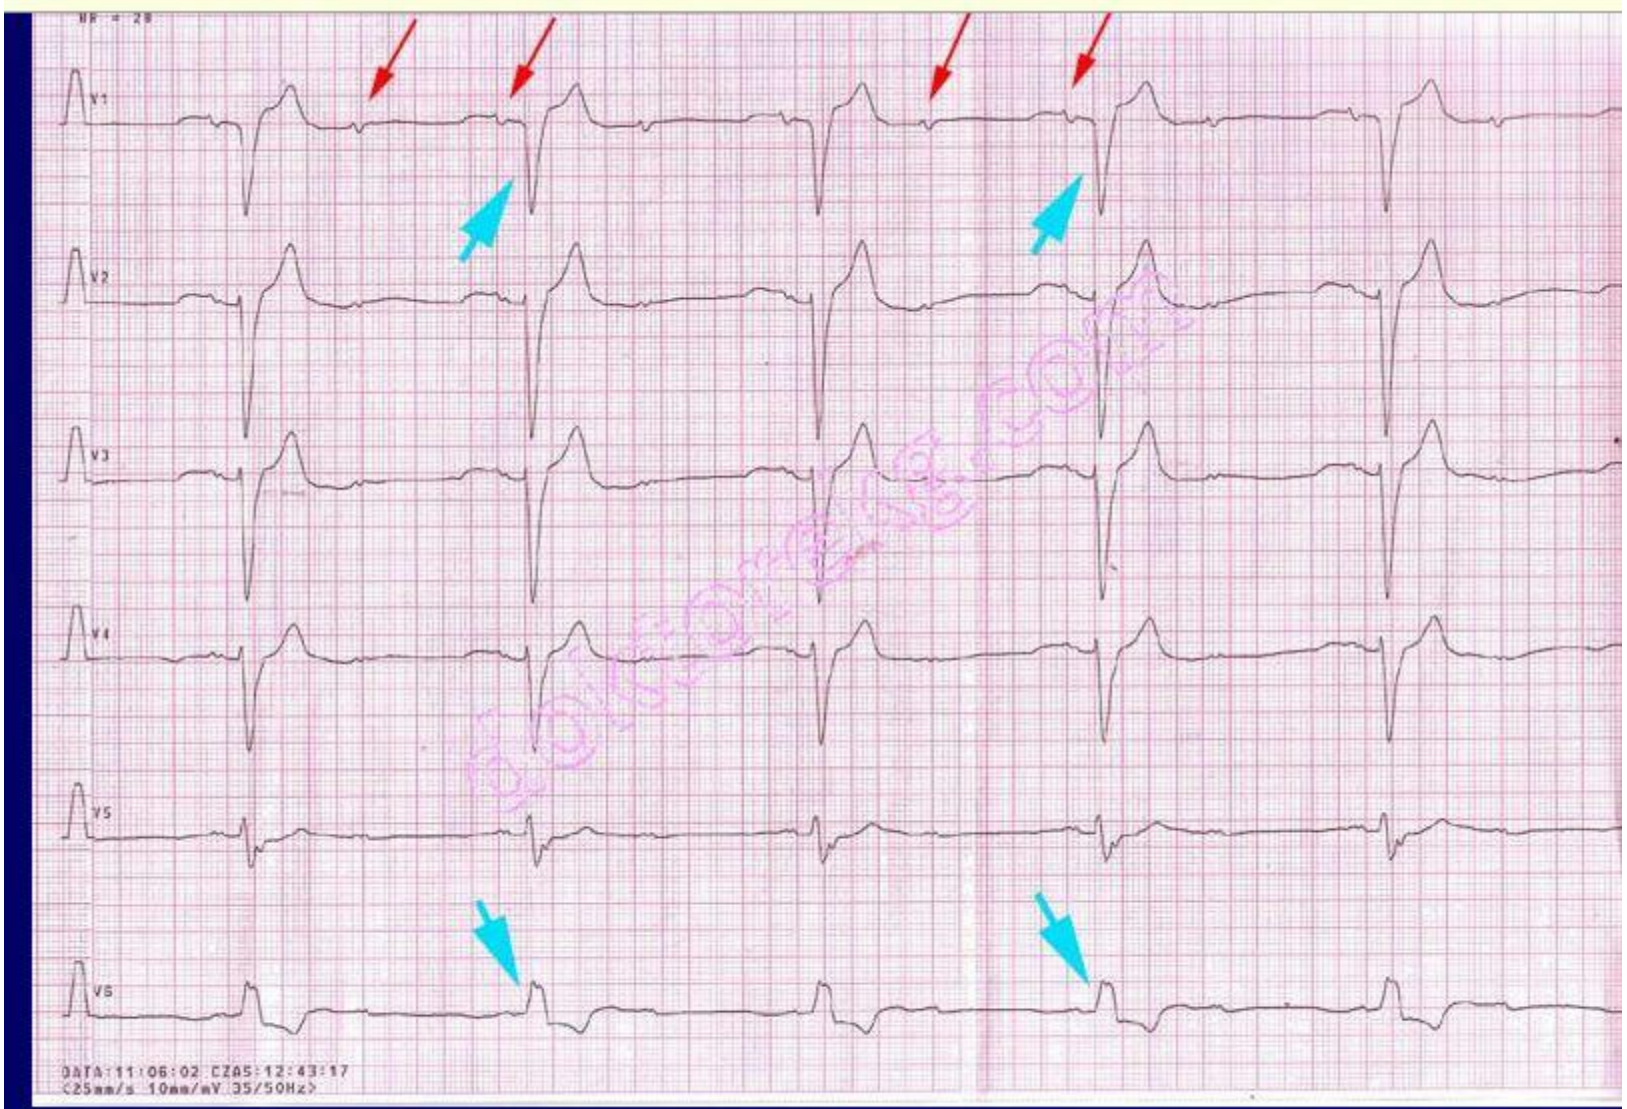
P Waves look Similar!



Successively longer PRIs until one QRS fails

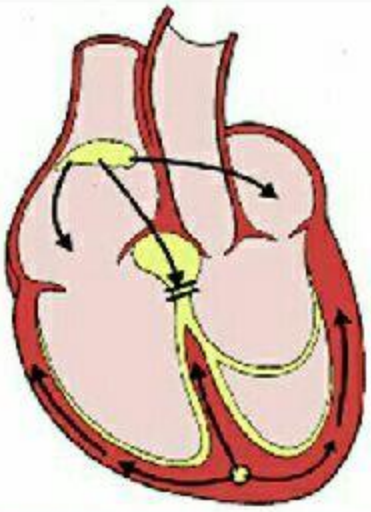
Rhythm (ventricular) is often irregular

Atrial rhythm is ~ **regular,** QRS is normal

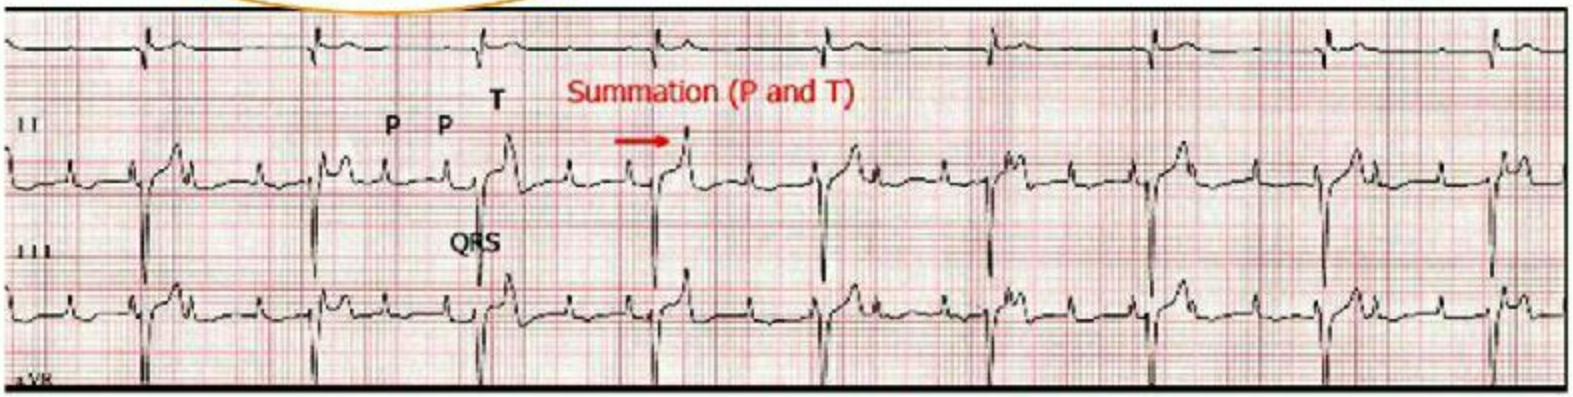


ECG 2. Mobitz Type 2 second degree AV block. This is a 2:1 block and the presence of wide QRS complex supports the diagnosis of Mobitz type 2 block. Of every 2 P wave s, only 1 is conducted to the ventricles.

Third degree AV block or complete AV block



گروه پرستاران



*None of P waves conduct to ventricles (P-P and QRS-QRS are independent)
*Slow, regular ventricular escape rhythm

Third-degree S.A. block

In this arrhythmia, some impulses are blocked, causing long sinus pauses. The pause isn't a multiple of the sinus rhythm. On an ECG, third-degree SA block looks similar to sinus arrest but results from a different cause.

Third-degree SA block is caused by a failure to conduct impulses; sinus arrest results from failure to form impulses. Failure in each case causes atrial activity to stop.

In sinus arrest, the pause often ends with a junctional escape beat. In third-degree block, the pause lasts for an indefinite period and ends with a sinus beat.

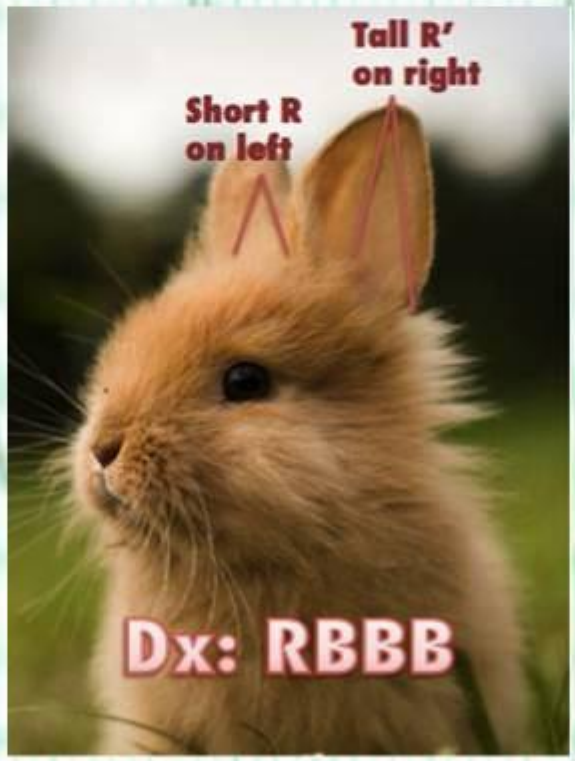
RBBB

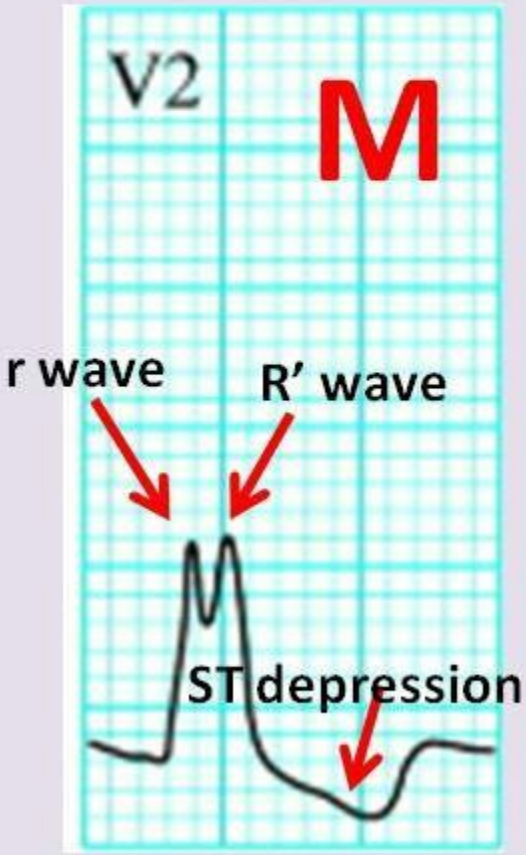
- Broad QRS > 120 ms
- RSR' pattern in V1, V2 ('M-shaped' QRS)
- Wide, slurred S wave in (I, aVL,V5, V6)
- ST depression and T wave inversion in (V1, V2, V3)



MSSHERMEH@YAHOO.CO

Right Bundle Branch Block (MARROW)

Lead V2: Shows the characteristic secondary R' wave in a complex known as **r S R'** . The R' is late right ventricular depolarisation. Note the M shape of Marrow



R

Lead I: Shows the characteristic slurred S wave which is how delayed right ventriclular depolarisation manifests in the lateral leads. Note the W shape of marroW.

Various RBBB Morphologies Lead V1

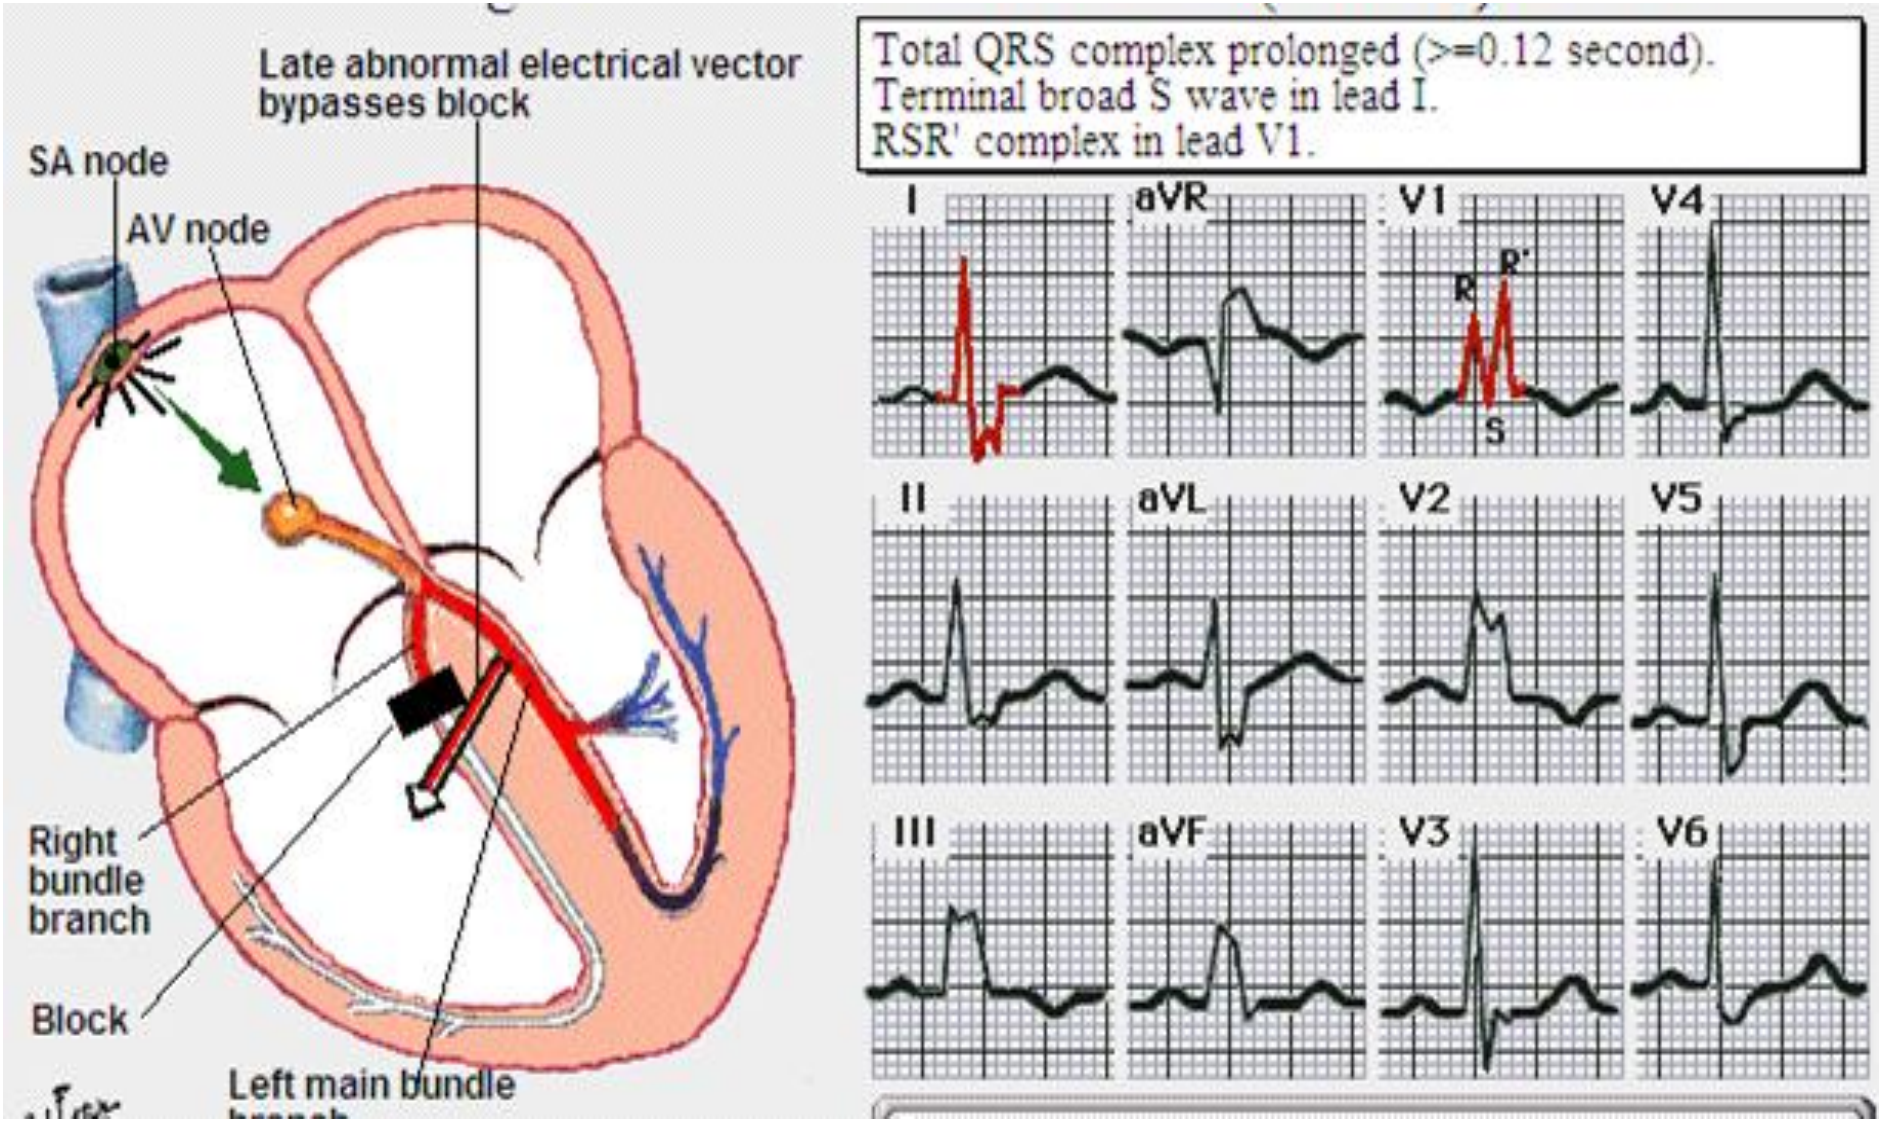
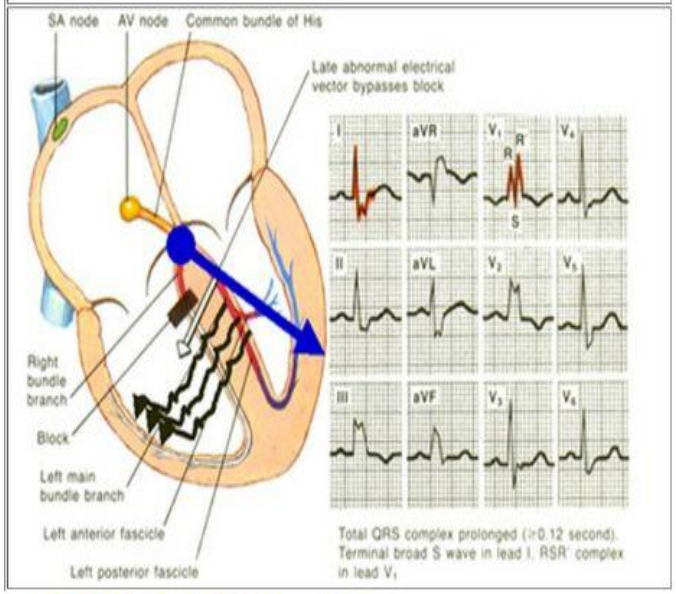
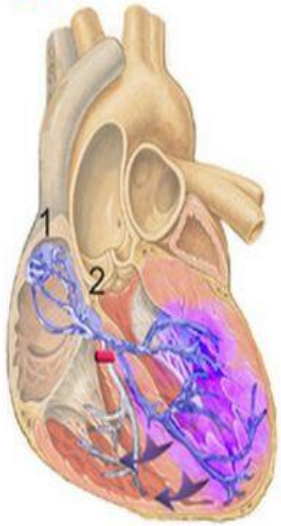
Complete RBBB



Right Bundle Branch Block



Right Bundle Branch Block (RBBB)



Dr.Nabil Paktin , MD.,Cardiology Case series

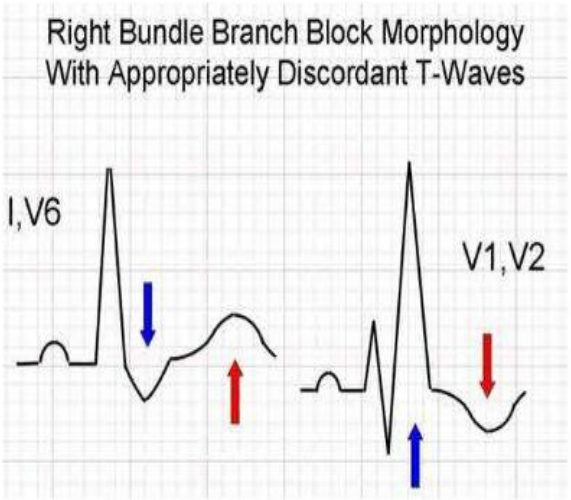
www.afghanheart.wordpress.com

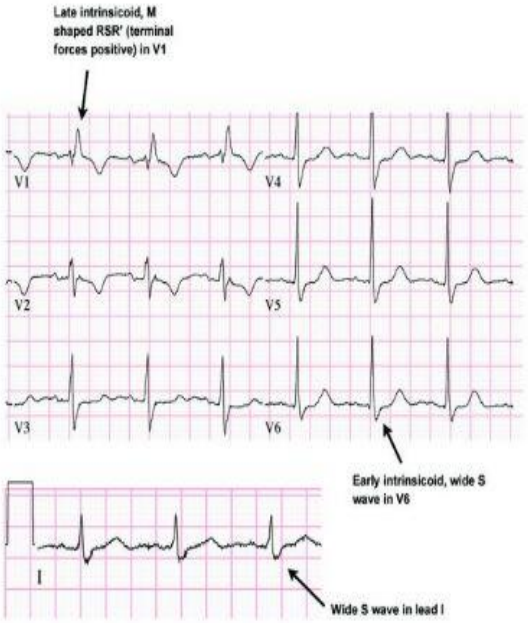
RBBB Criteria (Check QRS 1st)

- **Look in V_1 & V_2**
  - R, R^1 wave!
- **Look in V_5, V_6, & Lead I**
  - "slurred S wave"

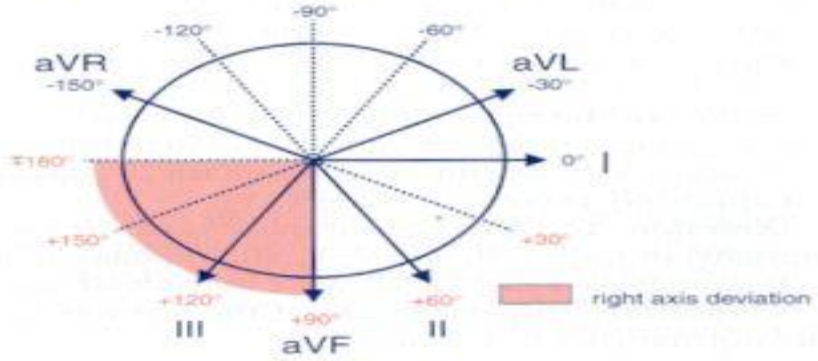
V_6

Lead I

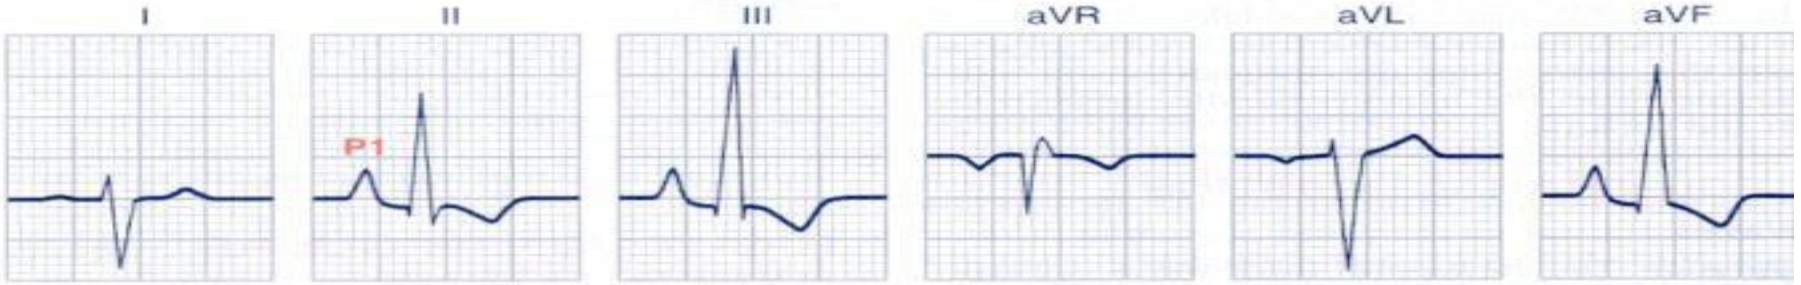


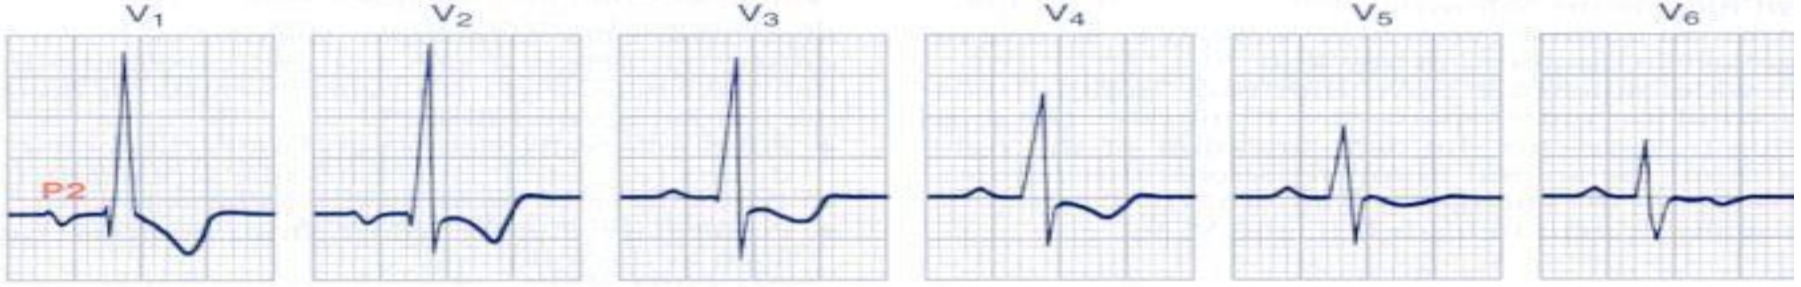


Right Ventricular Hypertrophy

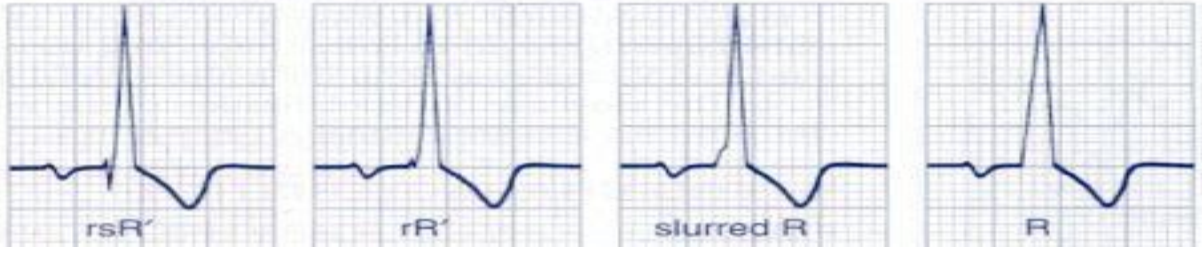


P1: P pulmonale
P2: biphasic P wave



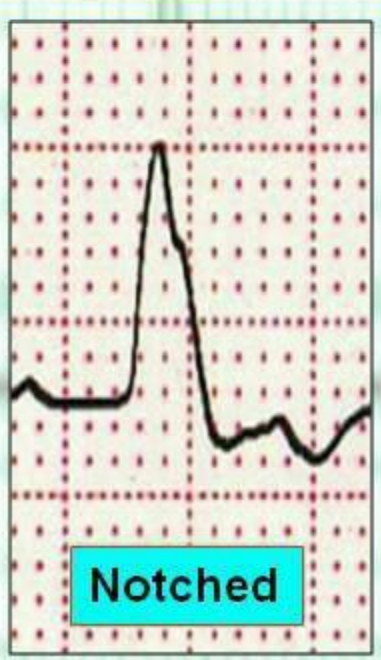


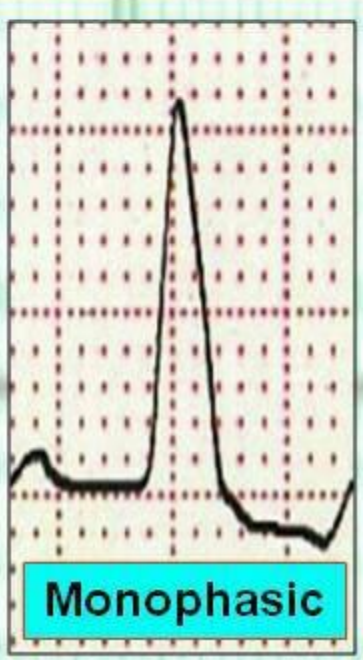
variations in the initial portion of the QRS complex in lead V_1

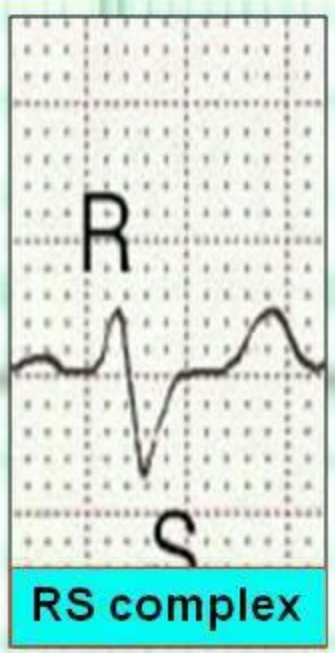


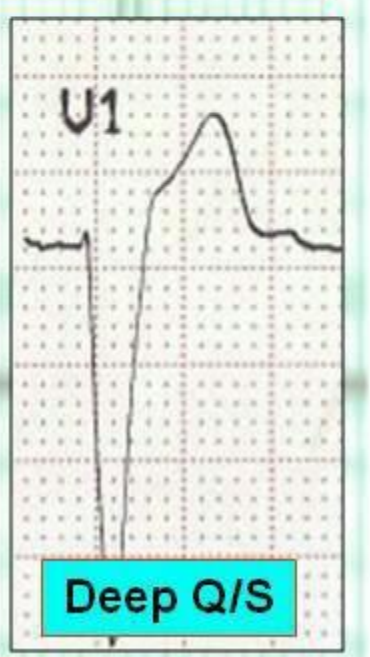
LBBB

- QRS duration of 120 ms
- Deep Q/S wave with no preceding R wave(V1,V2,V3,V4)
- Wide monophasic R wave in lateral leads (I, aVL, V5-V6)
- QRS Morphology in I,aVL,V5,V6('M' shaped, Notched, Monophasic, RS complex)
- Left axis deviation







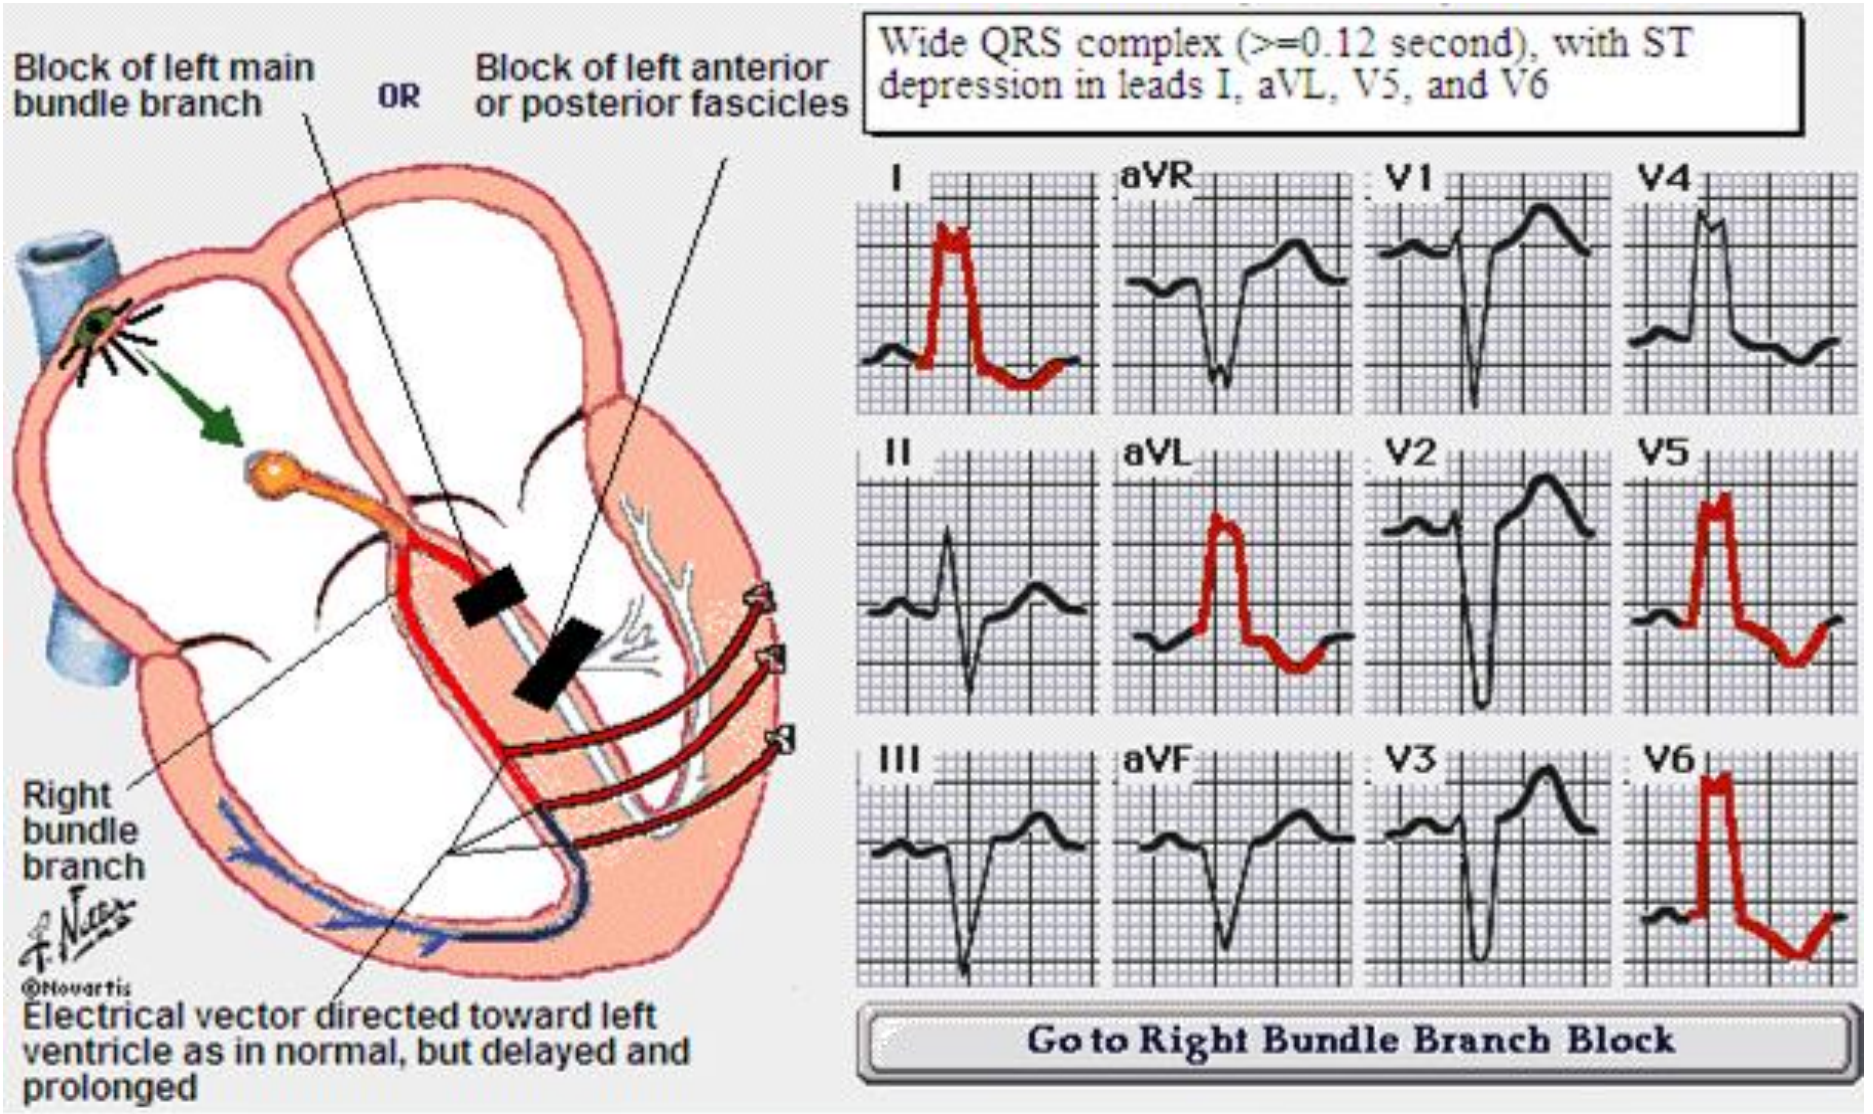


MSSHERMEH@YAHOO.COM

Complete LBBB

- Complete LBBB has a QRS duration > 0.12 sec
- Prominent S waves in lead V1, R in L I, aVL, V6
- Usually broad, Bizarre R waves are seen, M pattern
- Poor R progression from V1 to V3 is common.
- The "normal" ST-T waves in LBBB should be oriented opposite to the direction of the QRS
- Incomplete LBBB looks like LBBB but QRS duration is 0.10 to 0.12 sec, with less ST-T change.
- This is often a progression of LVH changes.

Complete LBBB



Causes of RBBB	Causes of LAFB
•Normal variant. •Cor pulmunale. •Pulmonary embolism. •MI, CMP`S, HHD,CHD •Mechanical damage. •Lev`s disease.	•Chronic hypertension •Aortic stenosis •Aortic root dilation •Dilated cardiomyopathy •Impairment of the cardiac electrical conduction system •Acute myocardial infarction •Lung diseases •Aging •Degenerative fibrotic disease

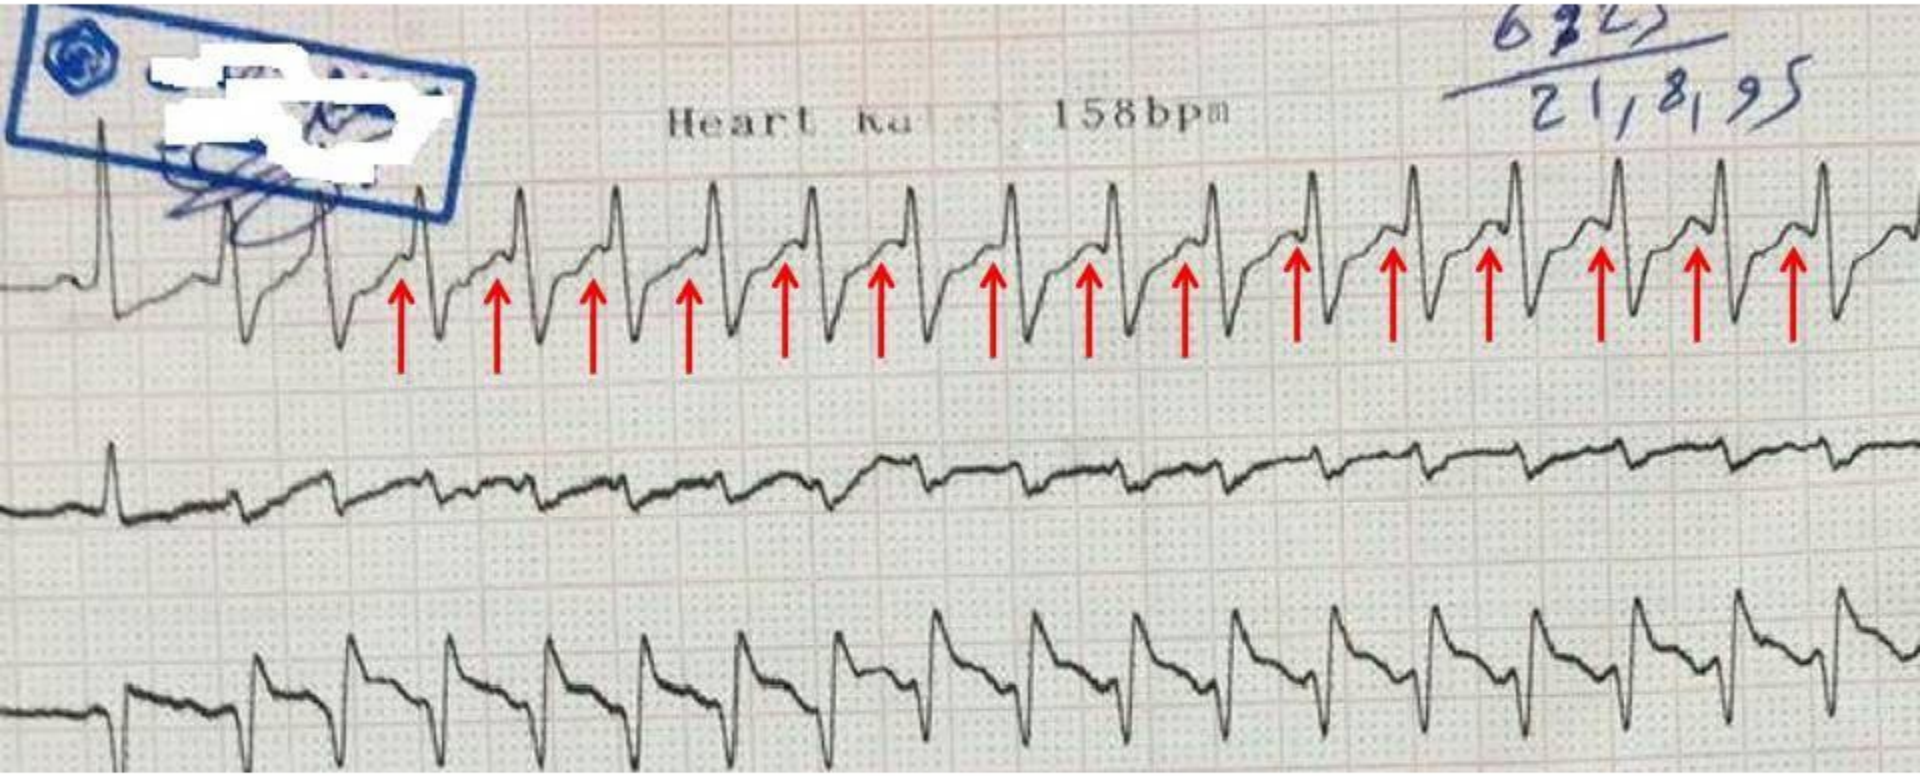
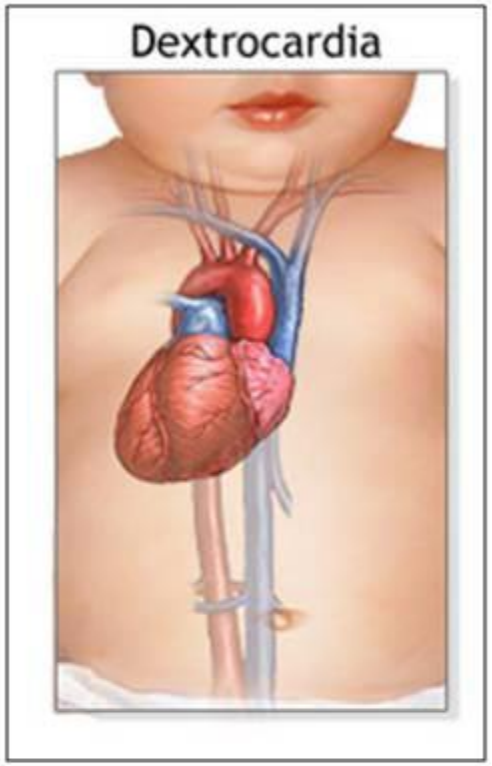
AV dissociation

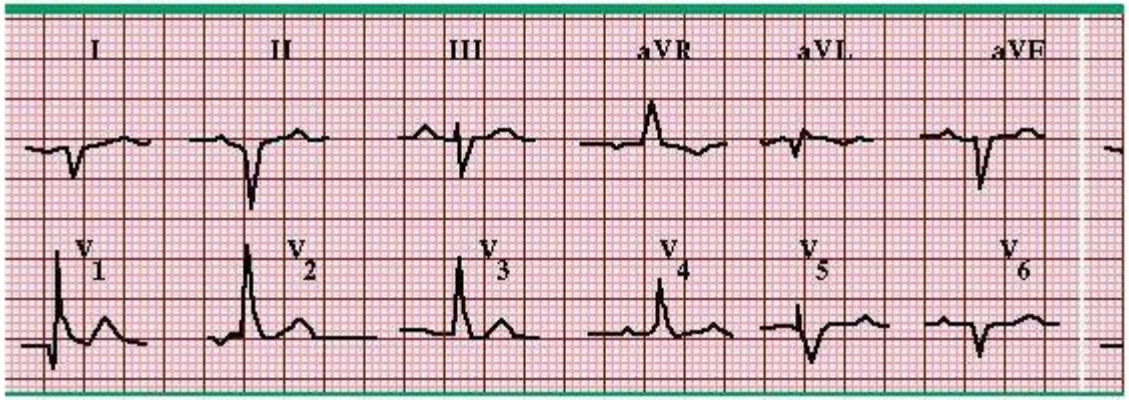




Dextrocardia

- Right axis deviation
- AVR : Positive QRS complexes with upright P and T waves
- Lead I: (inverted P wave, negative QRS, inverted T wave)
- Absent R-wave in the chest leads (dominant S waves)

Dextrocardia



Characteristic changes of dextrocardia include a negative P wave and QRS complex in lead 1, since atrial and ventricular depolarization begin on the left and spread to the right. There is also reverse R wave progression across the precordium; the R wave is tallest in V1, and progressively decreases in amplitude in leads V2 to V6.

Right Atrial Enlargement (dilatation & hypertrophy)

- Increase pressure/volume results in overload in the RA.
- ECG Characteristics
  - Duration: P wave .10 or <
  - Shape: Tall/peaked in Leads II,III & aVF, biphasic in V1 & V2
  - Direction: Positive
  - Amplitude: 2.5mm or >
  - Causes PS,TS, TI, Pulmonary Hypertension

II

Left Atrial Enlargement (dilatation/hypertrophy)

- Increase pressure/volume results in overload in the LA.
- ECG Characteristics
  - Duration: P wave >.12
  - Shape: Broad positive upright, wide notched (two humps), biphasic
  - Direction: Positive Leads I,II & V4-V6
  - Amplitude: normal .5-2.5mm
  - Causes: MS, acute MI, LHF, AS or AI, HCOP

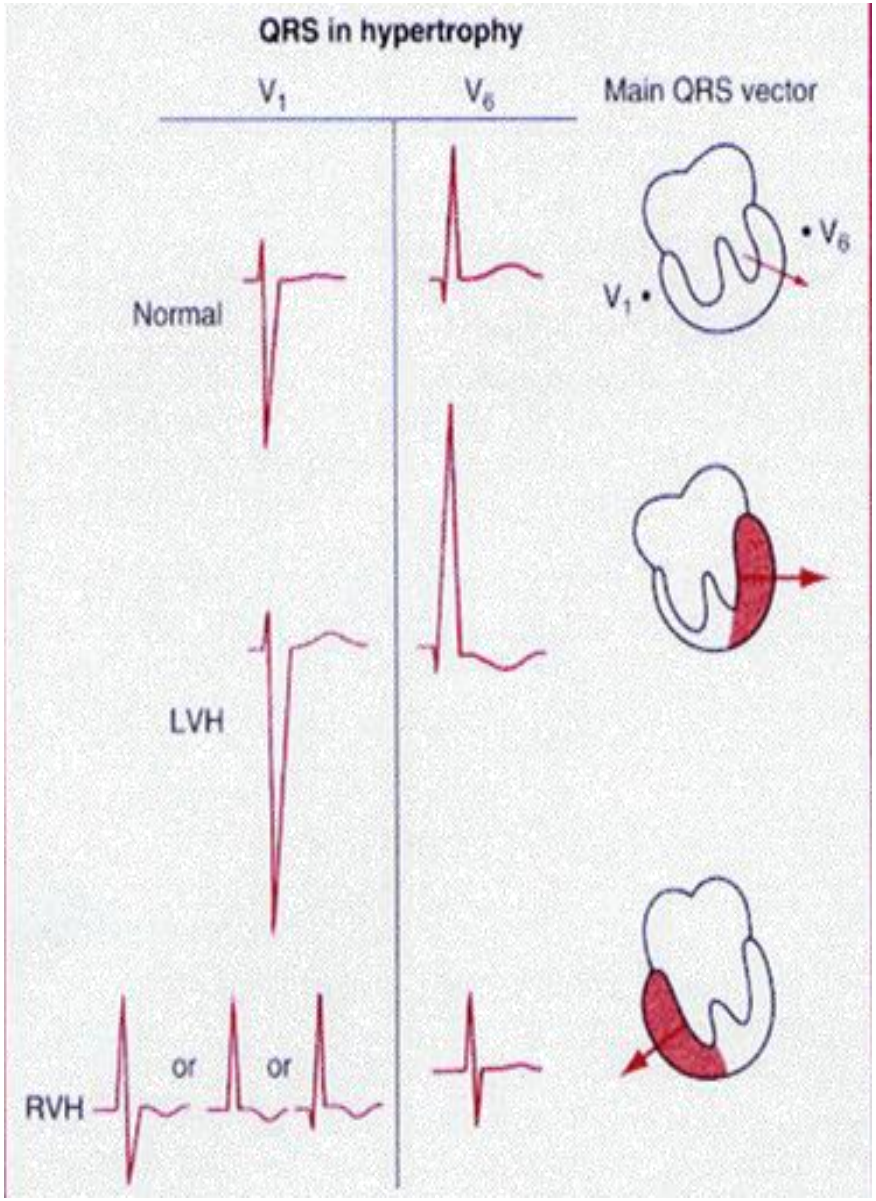
Ventricular Hypertrophy

- Ventricular Muscle Hypertrophy
- QRS voltages in V1 and V6, L 1 and aVL
- We may have to record to ½ standardization
- T wave changes opposite to QRS direction
- Associated Axis shifts
- Associated Atrial hypertrophy



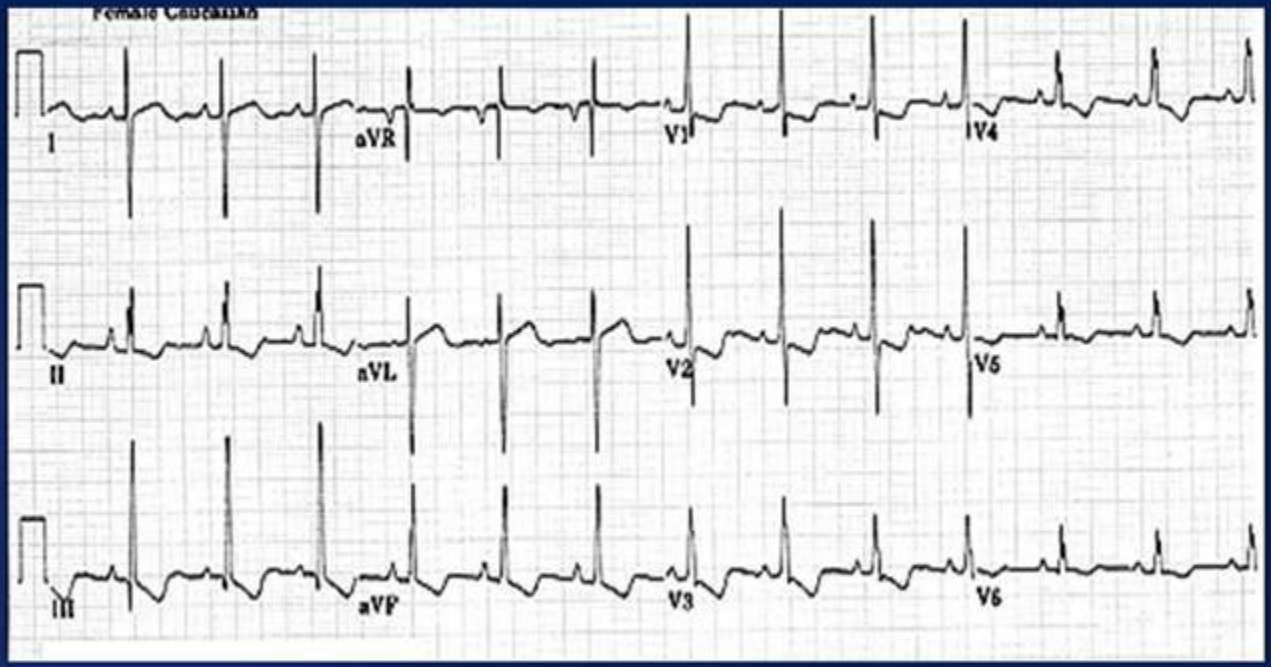
Right Ventricular Hypertrophy

- Increase pressure/volume results in overload in the RV.
- ECG Characteristics
  - Duration: QRS .10 or <
  - QRS Axis: RAD +90 ^{0} or <
  - VAT: prolonged = .035 sec in V1 & V2
  - QRS Pattern: q waves leads II,III & aVF
  - R waves: = or > S waves in Lead V1
  - ST segment: Downsloping of 1mm or >
  - Hockey stick: ST depression & T-wave inversion
  - T wave: inversion in II, III, aVF & V1,V2 & V3
  - Causes: MS, acute MI, COPD

Right ventricular hypertrophy

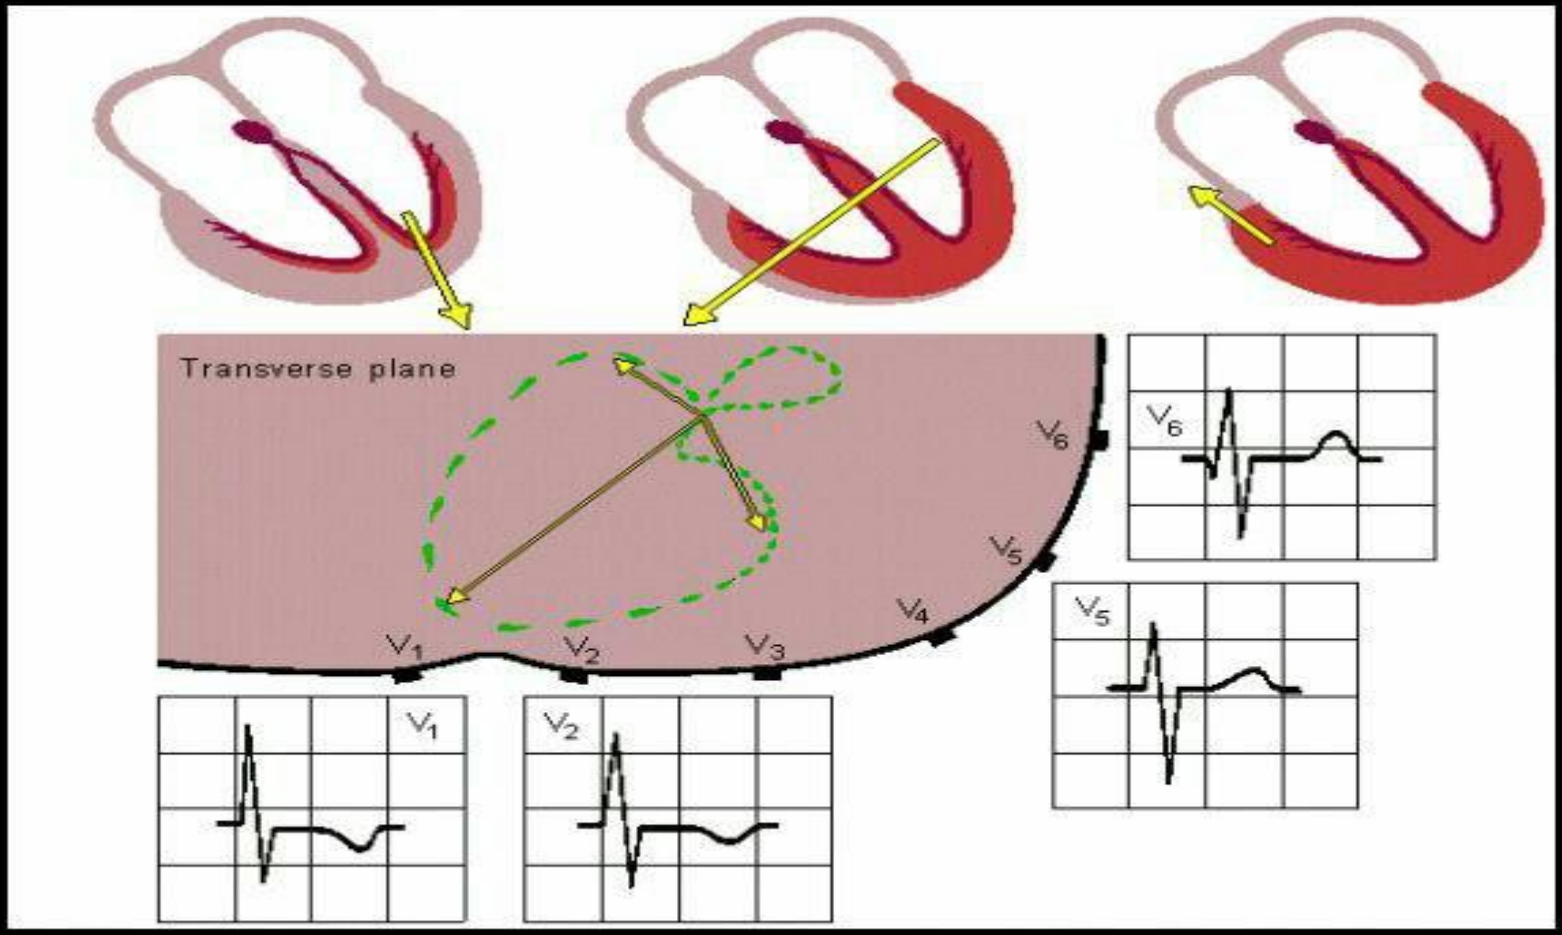
RVH

- Take a look at this ECG. What do you notice about the axis and QRS complexes over the right ventricle (V1, V2)?



There is right axis deviation (negative in I, positive in II) and there are tall R waves in V1, V2.

Right Ventricular Hypertrophy



Right Ventricular Hypertrophy Criteria

1. In V_1, R wave is greater than the S wave - or - R in V1 greater than 7 mm
    1. Right axis deviation
    2. In V_1, T wave inversion (reason unknown)
    3. S waves in V5 and V6

Left Ventricular Hypertrophy cont...

- ECG Characteristics cont..
  - Sum of R/S: Any R wave and S wave > 20 mm & Sum of S wave in V1 or V2 and R wave in Lead V5 or V6 is 35 mm or> .
  - ST segment: Downsloping ST depression of 1m or > in Leads I, aVL & V5, V6
  - T wave: Inversion in I, aVL & V5, V6

TABLE 12-4 Common Diagnostic Criteria for Left Ventricular Hypertrophy

MEASUREMENT	CRITERIA
Sokolow-Lyon voltages	$SV_1 + RV_5 > 3.5$ mV RaVL >1.1 mV
Romhilt-Estes point score system*	Any limb lead R wave or S wave > 2.0 mV (3 points) or SV_1 or $SV_2 \geq 3.0$ mV (3 points) or RV_5 to $RV_6 \geq 3.0$ mV (3 points) ST-T wave abnormality, no digitalis therapy (3 points) ST-T wave abnormality, digitalis therapy (1 point) Left atrial abnormality (3 points) Left axis deviation ≥–30 degrees (2 points) QRS duration ≥90 msec (1 point) Intrinsicoid deflection in V_5 or V_6 ≥50 msec (1 point)
Cornell voltage criteria	SV_3 + RaVL ≥2.8 mV (for men) SV_3 + RaVL >2.0 mV (for women)
Cornell regression equation	Risk of LVH = $1/(1+ e^{-exp})^{\dagger}$
Cornell voltage duration measurement	QRS duration × Cornell voltage >2436 mm-sec‡ QRS duration × sum of voltages in all leads >1742 mm-sec

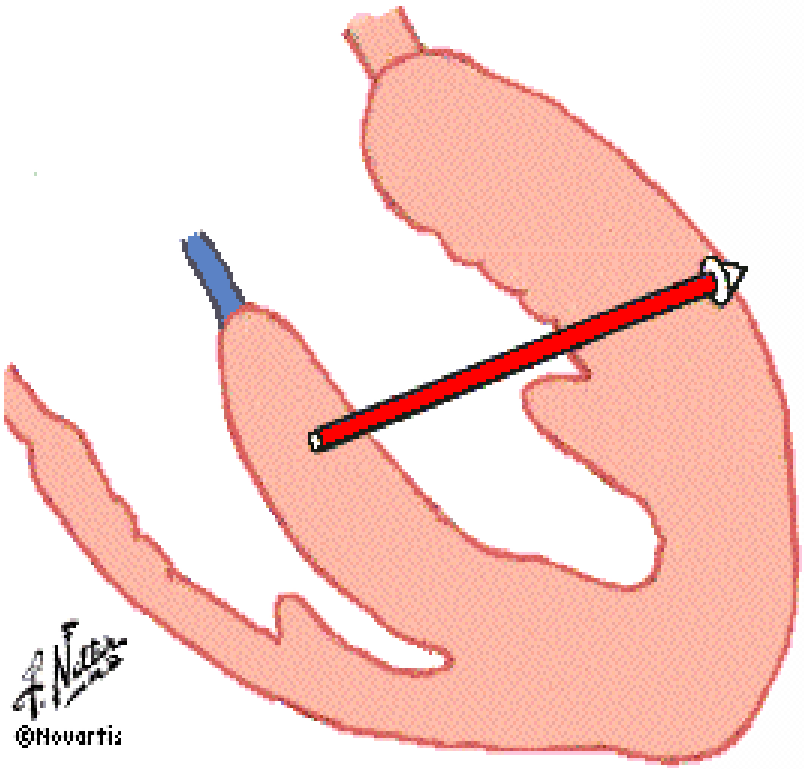
PTF = P terminal force; $PTFV_1$ = P terminal force in lead V_1.
*Probable LVH is diagnosed with totals of 4 points, and definite LVH is diagnosed with totals of 5 or more points.
†For subjects in sinus rhythm, exp = 4.558 − 0.092 (SV_3 + RaVL) − 0.306 TV_1 − 0.212 QRS − 0.278 $PTFV_1$ − 0.559 (sex). Voltages are in mV, QRS is QRS duration in milliseconds, PTF is the area under the P terminal force in lead V_1 (in mm-sec), and sex = 1 for men and 2 for women. LVH is diagnosed as present if exp < −1.55.
‡For women, add 8 mm.

Left Ventricular Hypertrophy

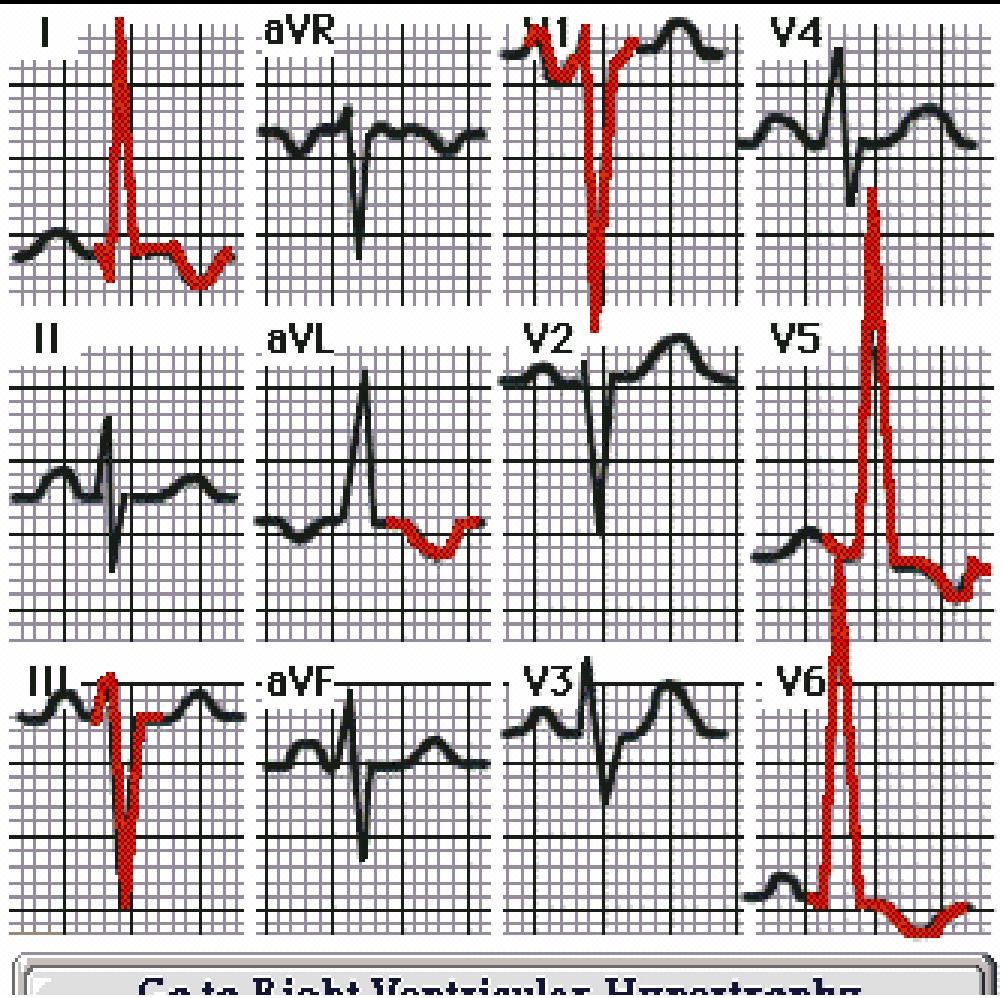
- High QRS voltages in limb leads
- R in Lead I + S in Lead III > 25 mm
- S in V1 + R in V5 > 35 mm
- R in aVL > 11 mm or S V3 + R aVL > 24 ♂, > 20 ♀
- Deep symmetric T inversion in V4, V5 & V6
- QRS duration > 0.09 sec
- Associated Left Axis Deviation, LAE
- Cornell Voltage criteria, Estes point scoring

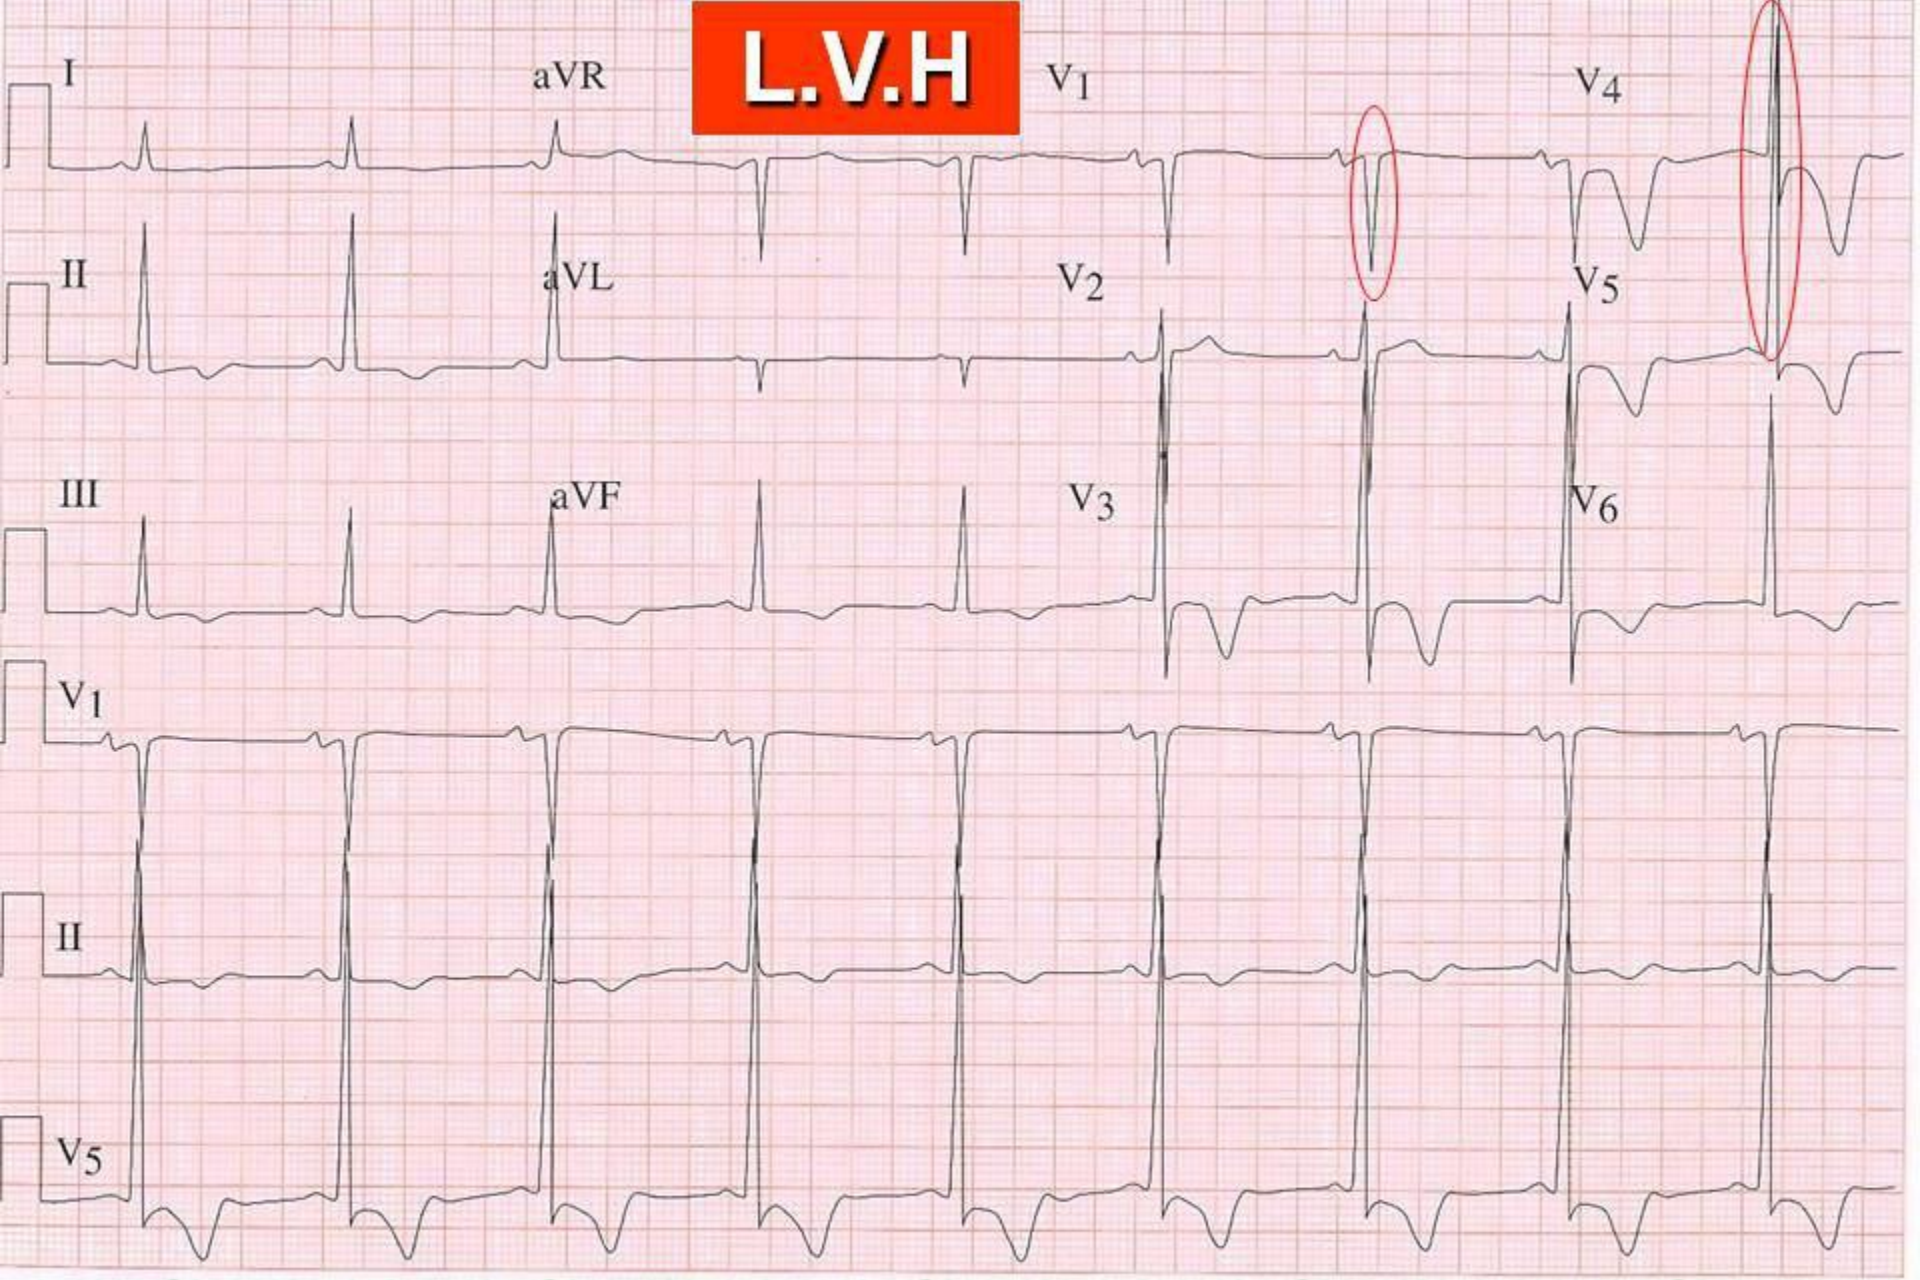
Left Ventricular Hypertrophy

High voltage in limb leads: (R I + S III >25 mm)
Or precordial leads: (S V1 + R V5, or S V1 + R V6, >=35 mm)
Often, left atrial enlargement, ST-T abnormalities



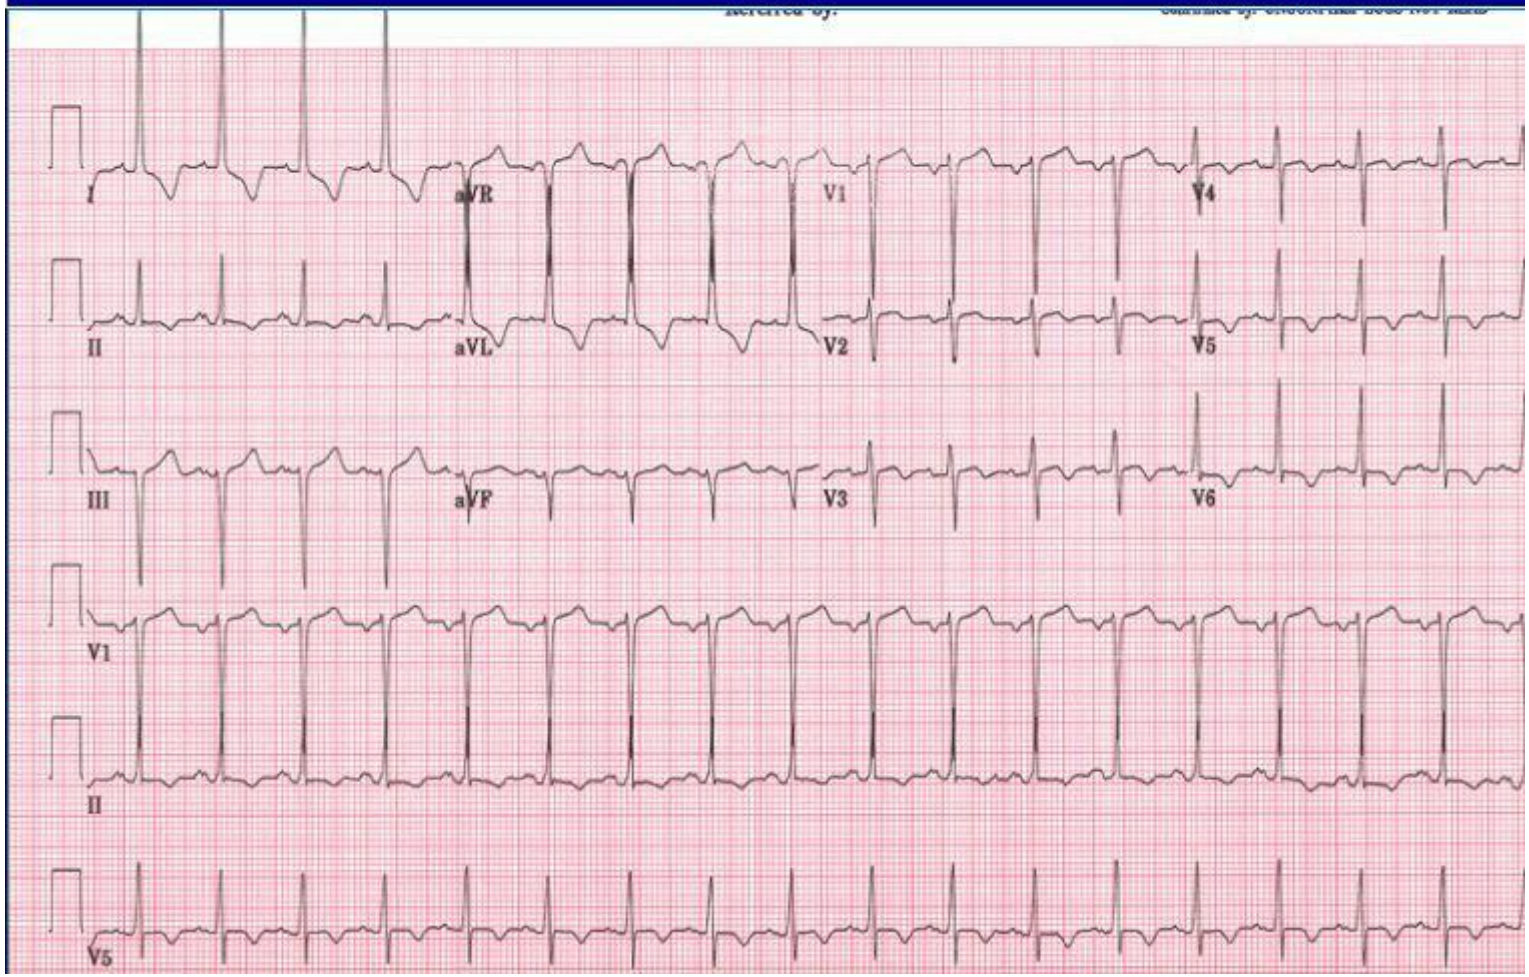
Arrow indicates major electrical vector of ventricular depolarization



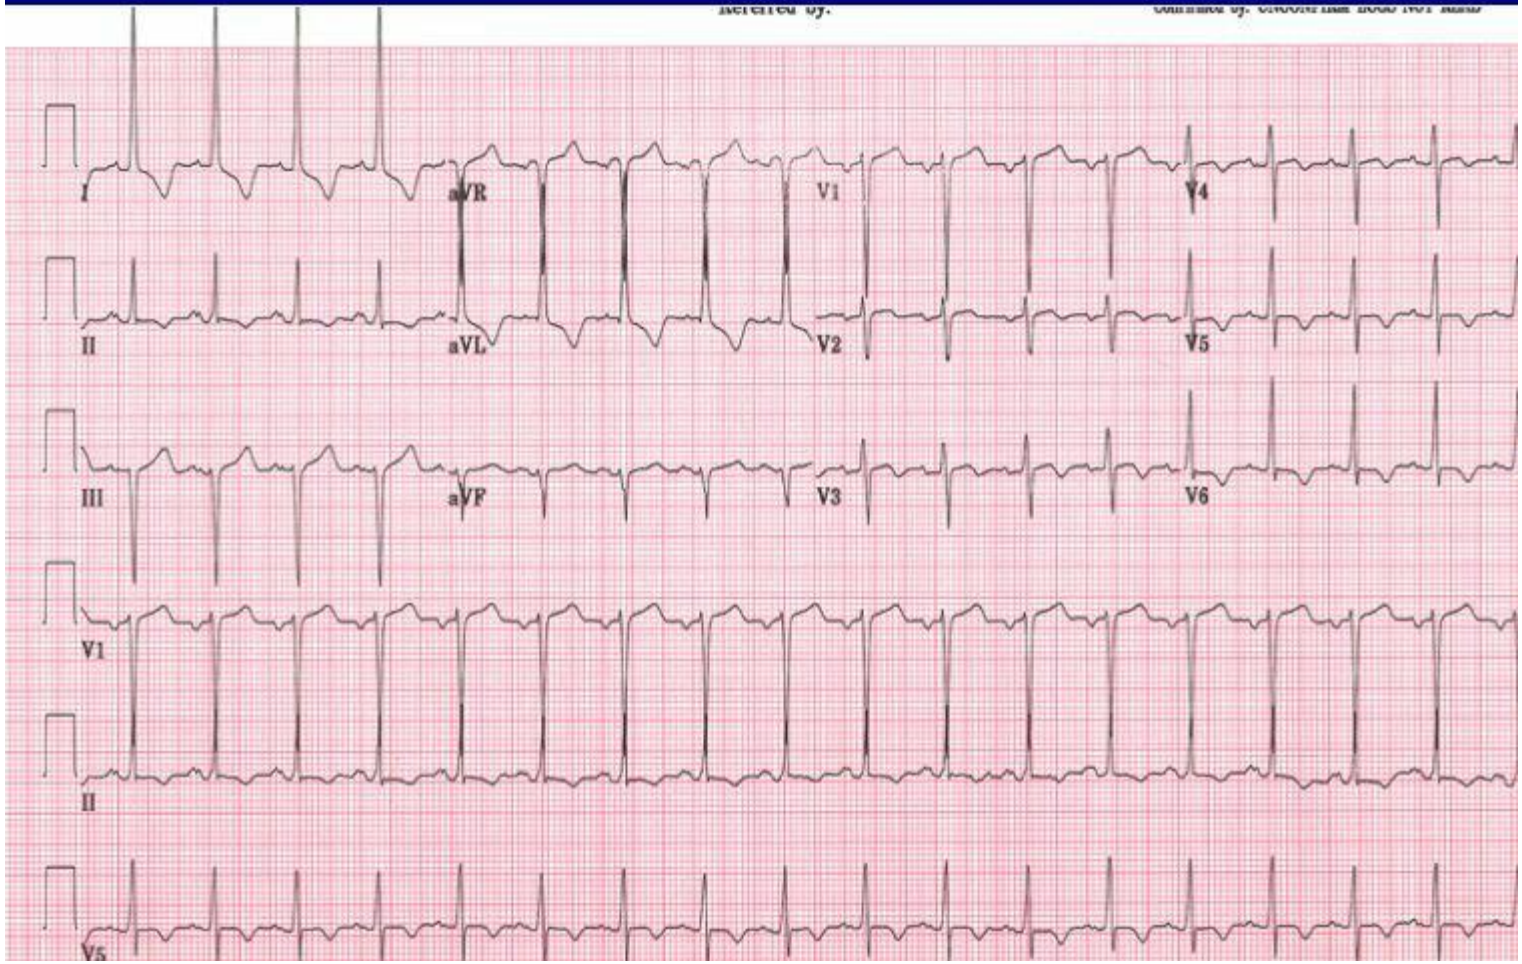


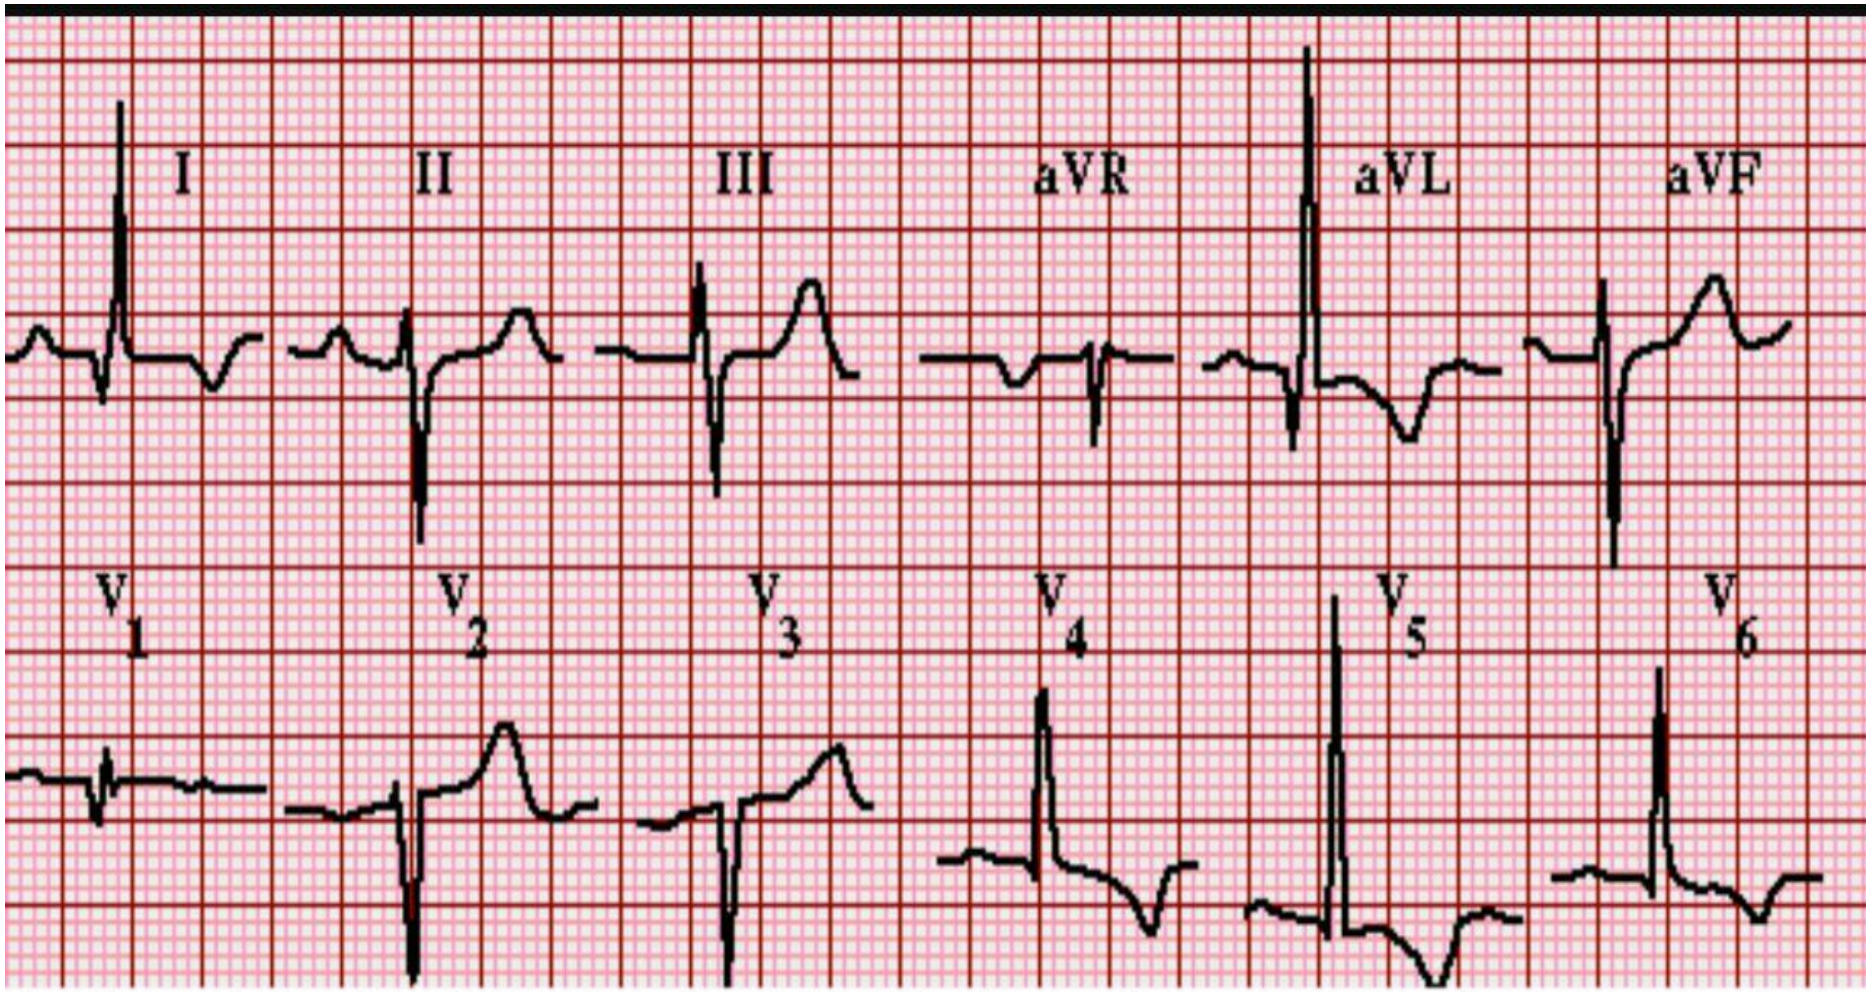
MSSHERMEH@YAHOO.COM

LVH By Cornell Product (QRS=80ms)



Sokolow-Lyon voltage criteria





Left ventricular hypertrophy This electrocardiogram demonstrates several features of left ventricular hypertrophy: the QRS complex is slightly widened due to an intraventricular conduction delay; there is left axis deviation; there is ST depression and inverted T waves noted in several leads; several voltage criteria are met, including an R wave in aVL which is greater than 18 mm (in this case 20 mm).

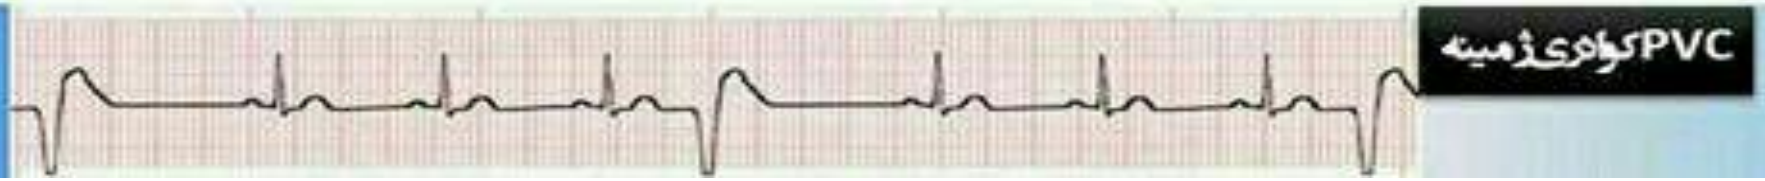
تشخیص خود PVC و انواع مختلف آن:

PVC یا ضربان زود رس بطنی، در EKG بصورت عکس شدن کمپلکس QRS و قطعه ST ظاهر می‌شود در واقع موج T و R عکس هم می شوند

PVC بای ژمینه، همان PVC است اما با این تفاوت که یک کمپلکس طبیعی داریم و یک PVCکه مرتب تکرار می شود

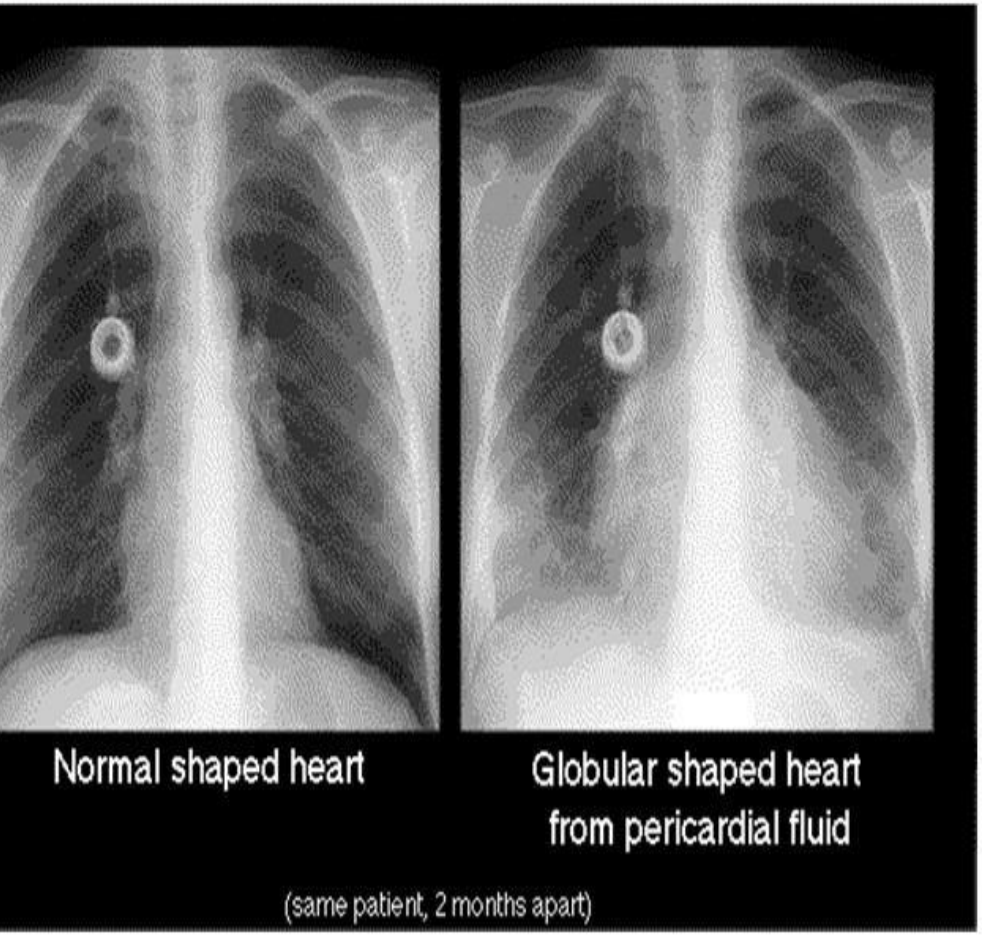
PVC تری ژمینه، همان PVC است اما با این تفاوت که دوکمپلکس طبیعی داریم و یک PVCکه مرتب تکرار می شود

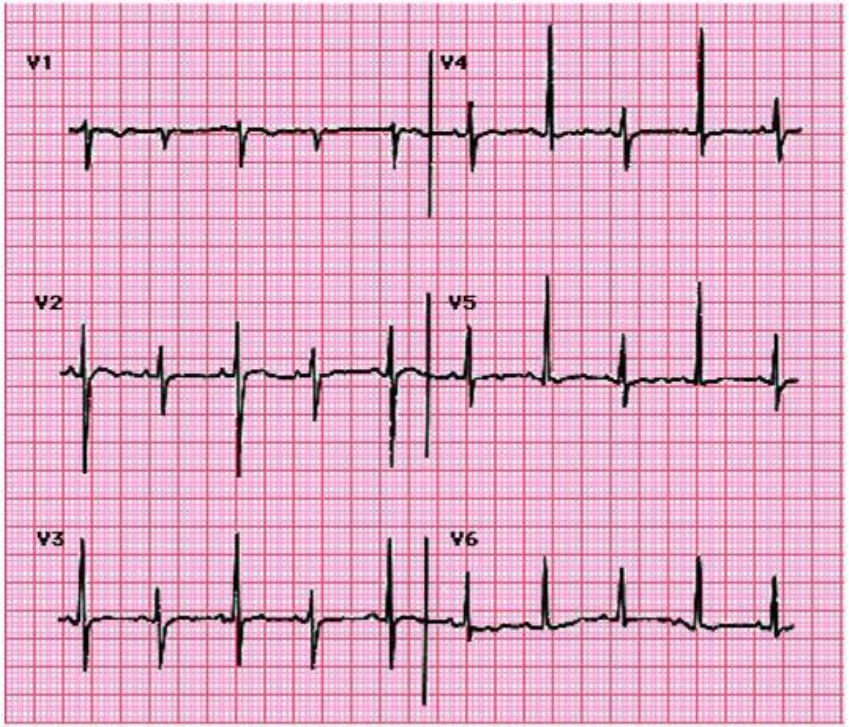
PVC کوادری ژمینه،همان PVC است اما با این تفاوت که سه کمپلکس طبیعی داریم و یک PVCکه مرتب تکرار می شود



تامپوناد قلبی (Cardiac tamponade)

تامپوناد قلبی ناشی از تحت فشار قرار گرفتن قلب بصورت آهسته یا سریع توسط خون، چرک، گاز و مایع تجمع‌یافته در فضای پریکارد ایجاد می‌شود.این حالت باعث کاهش جریان ورودی به قلب، کاهش حجم ضربه‌ای و در کل باعث اختلال در پویایی خون (اختلال همودینامیک) در بدن می‌شود





Electrical alternans Sinus tachycardia with electrical alternans which is characterized by beat-to-beat alternation in the QRS appearance (best seen in leads V2 to V4). These findings are strongly suggestive of pericardial effusion, usually with tamponade. The alternating ECG pattern is related to back-and-forth swinging motion of the heart in the pericardial fluid. Courtesy of Ary Goldberger, MD.
